

ADC354x 14-bit, 10-MSPS to 65-MSPS, Low-noise, Ultra-low Power ADC

1 Features

- 14-bit 10/25/65 MSPS ADC
- Noise floor: -155 dBFS/Hz
- Ultra-low power with optimized power scaling: 36 mW (10 MSPS) to 79 mW (65 MSPS)
- Latency: 1 clock cycle
- INL: ± 0.5 LSB; DNL: ± 0.05 LSB
- Reference: external or internal
- Input Bandwidth: 400 MHz (3-dB)
- Industrial temperature range: -40°C to $+105^{\circ}\text{C}$
- On-chip digital filter (optional)
 - Decimation by 2, 4, 8, 16, 32
 - 32-bit NCO
- SDR/DDR and Serial CMOS interface
- Small footprint: 40-VQFN (5 mm \times 5 mm) package
- Single 1.8-V supply
- Spectral Performance ($f_{\text{IN}} = 10$ MHz):
 - SNR: 79.0 dBFS
 - SFDR: 90 dBc HD2, HD3
 - SFDR: 100 dBFS Worst Spur
- Spectral Performance ($f_{\text{IN}} = 70$ MHz):
 - SNR: 75.0 dBFS
 - SFDR: 70 dBc HD2, HD3
 - SFDR: 90 dBFS Worst Spur

2 Applications

- [High-speed data acquisition](#)
- Industrial monitoring
- [Thermal imaging](#)
- [Imaging and sonar](#)
- [Software defined radio](#)
- Power quality analysis
- Communications infrastructure
- High-speed control loops
- Instrumentation
- [Smart grids](#)
- [Spectroscopy](#)
- [Radar](#)

3 Description

The ADC3541, ADC3542 and ADC3543 (ADC354x) family of devices are low-noise, ultra-low power, 14-bit, 10 to 65-MSPS, high-speed analog-to-digital converters (ADCs). Designed for low power consumption, these devices deliver a noise spectral density of -155 dBFS/Hz. The ADC354x offers great dc precision together with IF sampling support, which make these devices an excellent choice for a wide range of applications. High-speed control loops benefit from the short latency of only one clock cycle. The ADC consumes only 79 mW at 65 MSPS, and the power consumption scales very well with lower sampling rates.

The ADC354x uses an SDR, DDR or a serial CMOS interface to output the data offering the lowest power digital interface, together with the flexibility to minimize the number of digital interconnects. These devices are a pin-to-pin compatible family with different speed grades. These devices support the extended industrial temperature range of -40°C to $+105^{\circ}\text{C}$.

Device Information

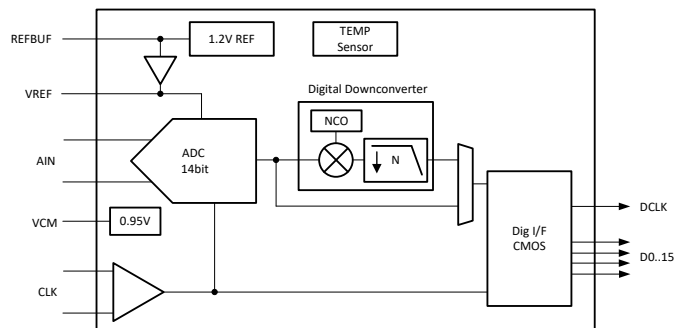

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
ADC354x	VQFN (40)	5.00 mm \times 5.00 mm

- (1) For all available packages, see the package option addendum at the end of the data sheet.

Device Comparison

PART NUMBER	RESOLUTION	SAMPLING RATE
ADC3543 ⁽¹⁾	14 bit	65 MSPS
ADC3542 ⁽¹⁾	14 bit	25 MSPS
ADC3541	14 bit	10 MSPS

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision * (June 2020) to Revision A (July 2020)	Page
• Added "external 1.6 V reference, 5 pF output load" to typical characteristics description.....	14
• Changed the <i>Single Ended Input</i> section.....	20
• Changed the description of the single ended clock and diagram.....	23
• Added the Note for power down only with sampling clock present.....	41
• Changed the register description for register 0x0A/B/C, updated register 0x1B.....	43
• Changed the register description for register 0x0A/B/C, updated register 0x1B.....	44

5 Pin Configuration and Functions

Pin Descriptions

PIN		I/O	DESCRIPTION
NAME	NO.		
INPUT/REFERENCE			
AINM	14	I	Negative analog input
AINP	13	I	Positive analog input
REFBUF	4	I	1.2-V external voltage reference input for use with internal reference buffer. Internal 100 kΩ pull-up resistor to AVDD. This pin is also used to configure default operating conditions.
REFGND	3	I	Reference ground input
VCM	9	O	Common-mode voltage output for the analog inputs, 0.95 V
VREF	2	I	External voltage reference input, 1.6 V.
CLOCK			
CLKM	7	I	Negative differential sampling clock input for the ADC
CLKP	6	I	Positive differential sampling clock input for the ADC
CONFIGURATION			
NC	18	-	Do not connect
PDN/SYNC	1	I	Power down, synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal 21 kΩ pull-down resistor.
RESET	10	I	Hardware reset; active high. This pin has an internal 21 kΩ pull-down resistor.

ADC3541

SBAS840A – JULY 2020 – REVISED SEPTEMBER 2020

PIN		I/O	DESCRIPTION
NAME	NO.		
SCLK	40	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.
SDIO	39	I	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.
SEN	17	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD.
DIGITAL INTERFACE			
D0	38	O	CMOS output used with 16 bit output (configured via output bit formatter). This becomes LSB. When not used can be left unconnected.
D1	37	O	CMOS output used with 16 bit output (configured via output bit formatter). This becomes LSB-1. When not used can be left unconnected.
D2	36	O	CMOS output for data bit D0.
D3	35	I/O	CMOS output for data bit D1. Used as DCLKIN in serial CMOS output modes.
D4	34	O	CMOS output for data bit D2.
D5	33	O	CMOS output for data bit D3.
D6	32	O	CMOS output for data bit D4.
D7	30	O	CMOS output for data bit D5.
D8	29	O	CMOS output for data bit D6.
D9	28	O	CMOS output for data bit D7.
D10	27	O	CMOS output for data bit D8.
D11	24	O	CMOS output for data bit D9. Lane 0 in serial CMOS output mode.
D12	23	O	CMOS output for data bit D10. Lane 1 in serial CMOS output mode.
D13	22	O	CMOS output for data bit D11.
D14	21	O	CMOS output for data bit D12.
D15	20	O	CMOS output for data bit D13 (MSB).
DCLK	26	O	CMOS output for data bit clock
FCLK	19	O	Frame clock output in serial CMOS output mode.
POWER SUPPLY			
AVDD	5,8,11,16	I	Analog 1.8-V power supply
GND	12,15 PowerPAD	I	Ground, 0 V
IOGND	25	I	Ground, 0 V for digital interface
IOVDD	31	I	1.8-V power supply for digital interface

ADVANCE INFORMATION

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD, IOVDD		-0.3	2.1	V
Supply voltage range, GND, IOGND, REFGND		-0.3	0.3	V
Voltage applied to input pins	AINP/M	-0.3	2.1	V
	CLKP/M	-0.3	2.1	
	VREF, REFBUF	-0.3	2.1	
	PDN, RESET, SCLK, SEN, SDIO	-0.3	2.1	
	D3 (DCLKIN)	-0.3	2.1	
Junction temperature, T _J			105	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	750

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD ⁽¹⁾	1.725	1.8	1.9	V
	IOVDD ⁽¹⁾	1.725	1.8	1.9	V
T _A	Operating free-air temperature	-40		105	°C
T _J	Operating junction temperature			105 ⁽²⁾	°C

- (1) Measured to GND.
 (2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

6.4 Thermal Information

THERMAL METRIC		ADC354x	UNIT
		RSB (QFN)	
		40 Pins	
R _{ΘJA}	Junction-to-ambient thermal resistance	30.7	°C/W
R _{ΘJC(top)}	Junction-to-case (top) thermal resistance	16.4	°C/W
R _{ΘJB}	Junction-to-board thermal resistance	10.5	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	10.5	°C/W
R _{ΘJC(bot)}	Junction-to-case (bottom) thermal resistance	2.0	°C/W

6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 105^\circ\text{C}$, ADC sampling rate = 65 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC3541 - 10 MSPS						
I_{AVDD}	Analog supply current	External reference		17		mA
I_{IOVDD}	I/O supply current ⁽¹⁾	SDR CMOS		3		
P_{DIS}	Power dissipation ⁽¹⁾	External reference, SDR CMOS		36		mW
I_{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		TBD		mA
		Serial CMOS 2-wire		TBD		
		Serial CMOS 1-wire		TBD		
		4x complex decimation, SDR CMOS		TBD		
ADC3542 - 25 MSPS						
I_{AVDD}	Analog supply current	External reference		20		mA
I_{IOVDD}	I/O supply current ⁽¹⁾	SDR CMOS		5		mA
P_{DIS}	Power dissipation ⁽¹⁾	External reference, SDR CMOS		45		mW
I_{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		TBD		mA
		Serial CMOS 2-wire		TBD		
		4x complex decimation, SDR CMOS		TBD		
ADC3543 - 65 MSPS						
I_{AVDD}	Analog supply current	External reference		35		mA
I_{IOVDD}	I/O supply current ⁽¹⁾	SDR CMOS		9		
P_{DIS}	Power dissipation ⁽¹⁾	External reference, SDR CMOS		79		mW
I_{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		TBD		mA
		4x complex decimation, SDR CMOS		TBD		
MISCELLANEOUS						
I_{AVDD}	Internal reference, additional analog supply current	$F_S = 10$ MSPS		1		mA
		$F_S = 25$ MSPS		1.5		
		$F_S = 65$ MSPS		3.5		
I_{AVDD}	External reference, Internal reference buffer (REFBUF), additional analog supply current	Enabled via SPI		TBD		mA
			Single ended clock input, reduces analog supply current by		1	
P_{DIS}	Power consumption in global power down mode	Default power down mask, internal reference		5		mW
		Default power down mask, external reference		9		

(1) Measured with a 2 MHz input frequency full-scale sine wave at specified sample rate, with ~ 5 pF loading on each CMOS output pin.

6.6 Electrical Characteristics - DC Specifications

Typical values are over the operating free-air temperature range, at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 105^\circ\text{C}$, ADC sampling rate = 65 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DC ACCURACY						
No missing codes			14		bits	
ADC3541 - 10 MSPS: DC ACCURACY

7 Detailed Description

7.1 Overview

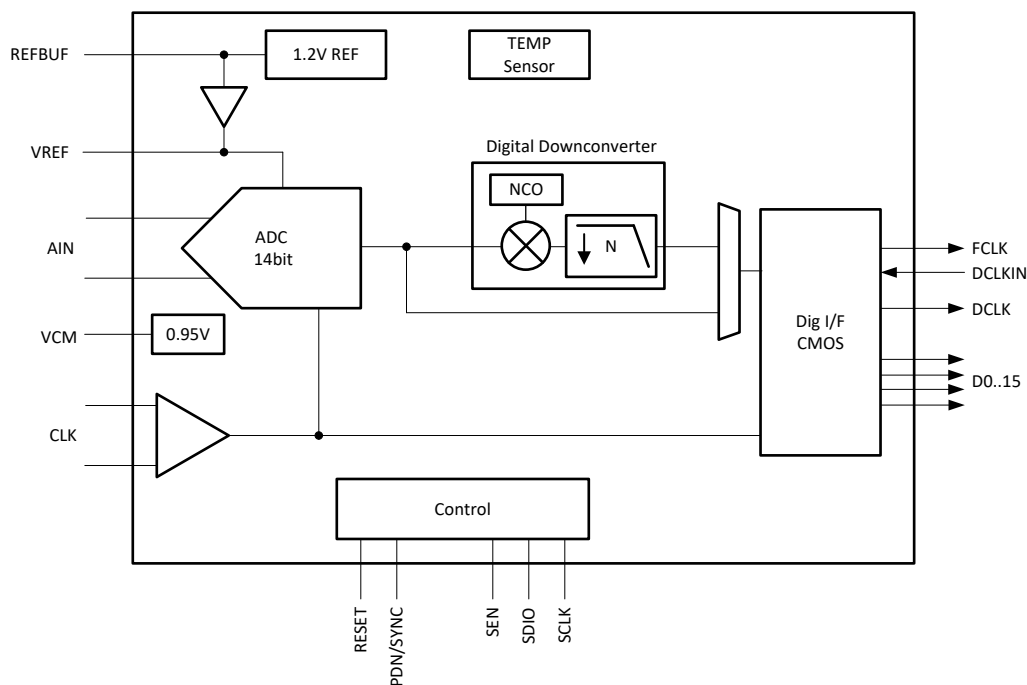

The ADC354x is a low noise, ultra-low power 14-bit high-speed ADC family supporting sampling rates from 10 to 65 Msps. It offers very good DC precision together with IF sampling support which makes it ideally suited for a wide range of applications. The ADC354x is equipped with an on-chip internal reference option but it also supports the use of an external, high precision 1.6 V voltage reference or an external 1.2 V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after only one clock cycle. Single ended as well as differential input signaling is supported.

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC354x family uses a SDR or DDR as well as a 2-wire or 1-wire serial CMOS interface to output the data offering lowest power digital interface together with the flexibility to minimize the number of digital interconnects. The ADC354x includes a digital output formatter which supports output resolutions from 14 to 20-bit. The device is a pin-to-pin compatible family with different speed grades.

The device features and control options can be set up either through pin configurations or via SPI register writes.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Input

The analog inputs of ADC354x are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in Figure 7-1. All four sampling switches, on-resistance shown in red, are in same position (open or closed) simultaneously.

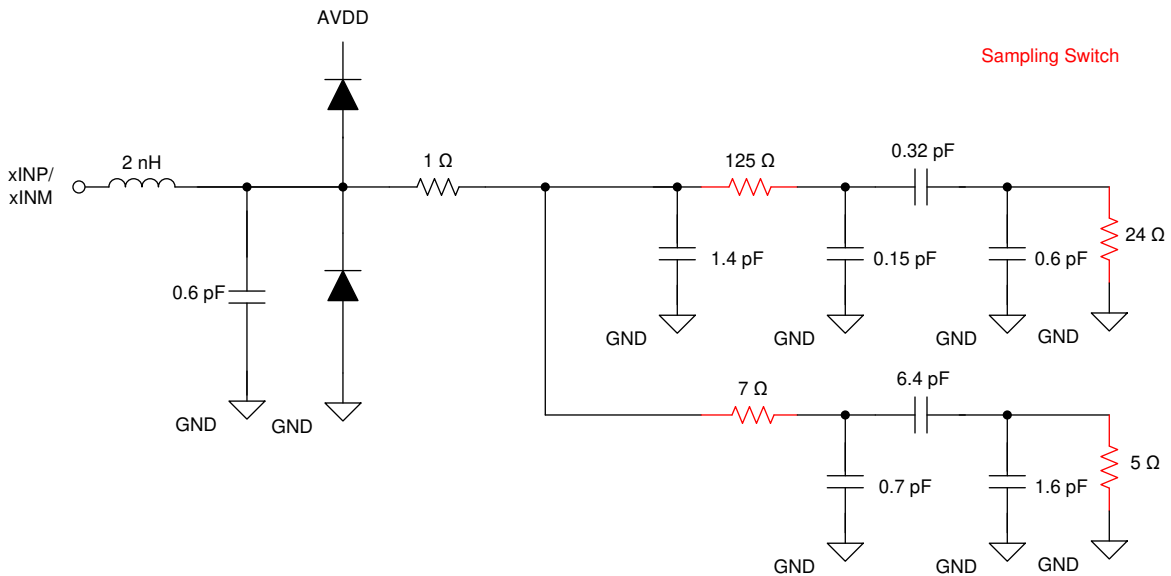

Figure 7-1. Equivalent Input Network

7.3.1.1 Analog Input Bandwidth

Figure 7-2 shows the analog full power input bandwidth of the ADC with a 50 Ω differential termination. The -3 dB bandwidth is approximately 900 MHz and the useful input bandwidth with good AC performance is approximately 120 MHz.

The equivalent input resistance R_{IN} and input capacitance C_{IN} vs frequency are shown in Figure 7-3.

Figure 7-2. ADC Analog Input bandwidth response

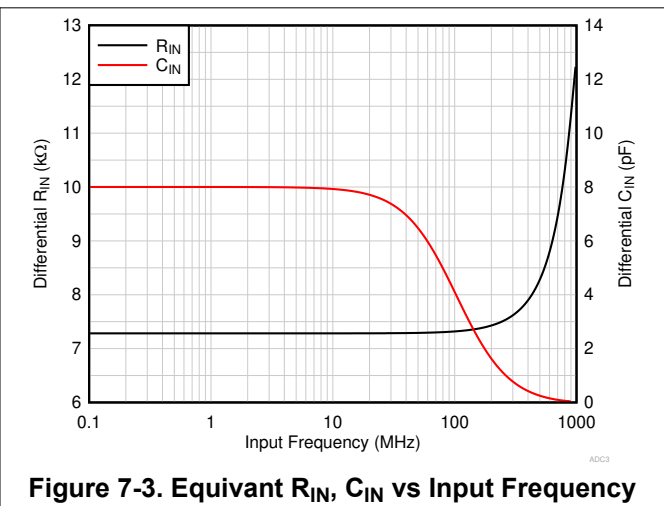

Figure 7-3. Equivalent R_{IN} , C_{IN} vs Input Frequency

7.3.1.2 Analog Front End Design

The ADC354x is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is needed in AC-coupled applications which can be combined with the termination network.

7.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in [Figure 7-4](#) and [Figure 7-5](#).

Figure 7-4. Sampling glitch filter example for input frequencies from DC to 30 MHz

Figure 7-5. Sampling glitch filter example for input frequencies from 30 to 70 MHz

7.3.1.2.2 Single Ended Input

The ADC can be configured to operate with single ended input instead of differential using just the positive signal input. This operating mode must be enabled via SPI register write (address 0x11). The single ended signal is connected to the negative ADC input and both the positive and negative input need to be biased to V_{CM} as shown in [Figure 7-6](#).

Figure 7-6. Single ended analog input: AC coupled (left) and DC coupled (right)

The signal swing is now reduced by 6-dB (single ended input with 1.125 V_{pp} vs differential 2.25 V_{pp}), and the resulting SNR is reduced by 3-dB.

7.3.1.2.3 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

7.3.1.2.3.1 AC-Coupling

The ADC354x requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in Figure 7-7. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.

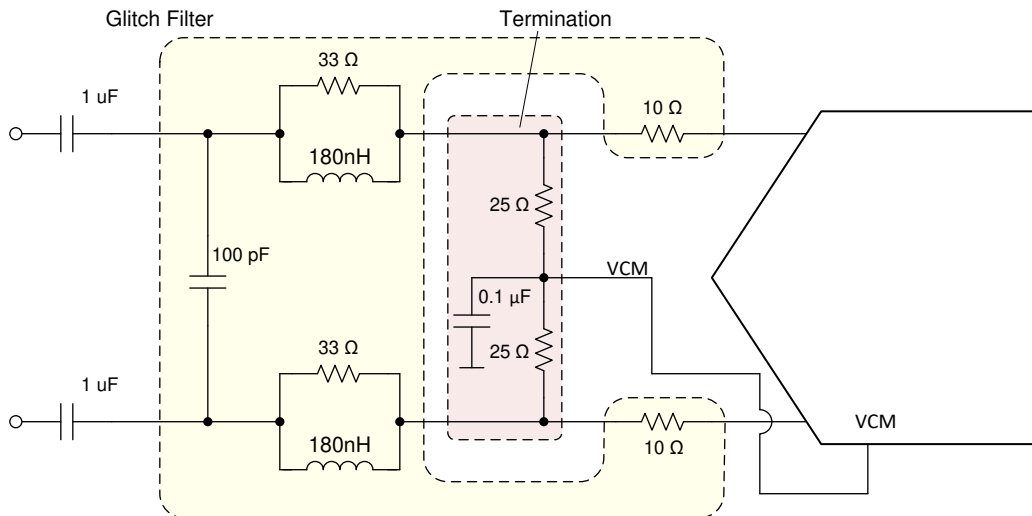

Figure 7-7. AC-Coupling: termination network provides DC bias (glitch filter example for DC - 30 MHz)

7.3.1.2.3.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in Figure 7-8. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.

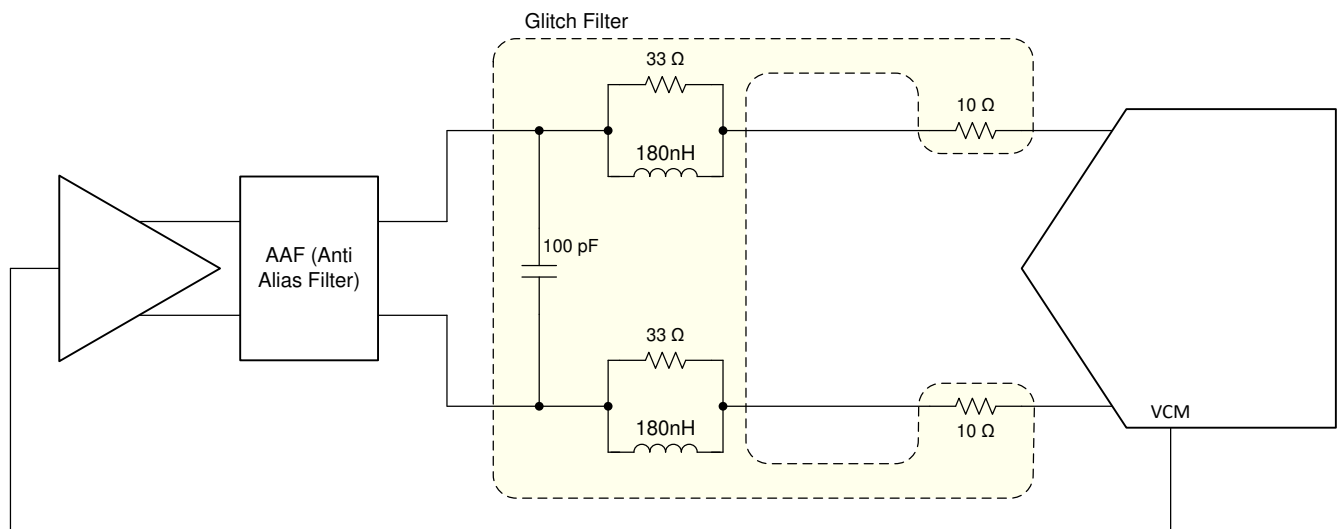

Figure 7-8. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 30 MHz)

7.3.1.3 Auto-Zero Feature

The ADC354x includes an internal auto-zero front end amplifier circuit which improves the 1/f flicker noise. This auto-zero feature is enabled by default for the ADC3541/2 and can be enabled using SPI register writes for the ADC3543 (register 0x11, D0). The feature works great for ADC sampling rates up to about 40 MSPS.

Figure 7-9. FFT at 25 MSPS with input frequency of 3 MHz (auto-zero feature enable vs disable, 4M point FFT)

Figure 7-10. FFT at 25 MSPS with input frequency of 3 MHz (auto-zero feature enable vs disable, 4M point FFT)

Figure 7-11. FFT at 40 MSPS with input frequency of 3 MHz (auto-zero feature enable vs disable, 4M point FFT)

Figure 7-12. FFT at 40 MSPS with input frequency of 3 MHz (auto-zero feature enabled vs disabled, 4M point FFT)

7.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications. For less jitter sensitive applications, the ADC354x provides the option to operate with single ended signaling which saves additional power consumption.

7.3.2.1 Single Ended vs Differential Clock Input

The ADC354x can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC354x provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9V center. The unused input needs to be AC coupled to ground.

Figure 7-13. External and internal connection using differential (left) and single ended (right) clock input

7.3.2.2 Signal Acquisition Time Adjust

The ADC354x includes a register (DLL PDN (0x11, D2) which increases the signal acquisition time window for clock rates below 40 MSPS from 25% to 50% of the clock period. Increasing the sampling time provides a longer time for the driving amplifier to settle out the signal which can improve the SNR performance of the system.

Note

This register needs to be set for the 65 MSPS speed grade (ADC3543) when operating at sampling rates below 40 MSPS. For the 10 and 25 MSPS device speed grades the sampling time is already set to $T_S/2$.

When powering down the DLL, the acquisition time will track the clock duty cycle (50% is recommended).

Table 7-1. Acquisition time vs DLL PDN setting

SAMPLING CLOCK F_S (MSPS)	DLL PDN (0x11, D2)	ACQUISITION TIME (t_{ACQ})
65	0	$T_S / 4$
≤ 40	1	$T_S / 2$

7.3.3 Voltage Reference

The ADC354x provides three different options for supplying the voltage reference to the ADC. An external 1.6 V reference can be directly connected to the VREF input; a voltage 1.2 V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2 V reference can be enabled to generate a 1.6V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 uF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC354x is shown in [Figure 7-14](#).

Note

The voltage reference mode can be selected using SPI register writes or by using the REFBUF pin (default) as a control pin ([Section 7.5.1](#)). If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

Figure 7-14. Different voltage reference options for ADC354x

7.3.3.1 Internal voltage reference

The 1.6 V reference for the ADC can be generated internal using the on-chip 1.2V reference along with the internal gain buffer. A 10 uF ceramic bypass capacitor (C_{VREF}) should be connected between the VREF and REFGND pins as close to the pins as possible.

Figure 7-15. Internal reference

7.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6 V reference. A 10 uF ceramic bypass capacitor (C_{VREF}) connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1 mA.

Note: The internal reference is also used for other functions inside the device, therefore the reference amplifier should only be powered down in power down state but not during normal operation.

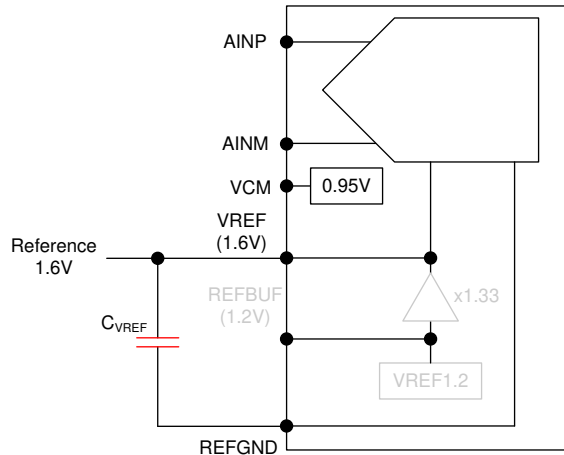

Figure 7-16. External 1.6 V reference

7.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC354x is equipped with an on-chip reference buffer that also includes gain to generate the 1.6V reference voltage from an external 1.2 V reference. A 10 uF ceramic bypass capacitor (C_{VREF}) between the VREF and REFGND pins and a TBD ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100 uA.

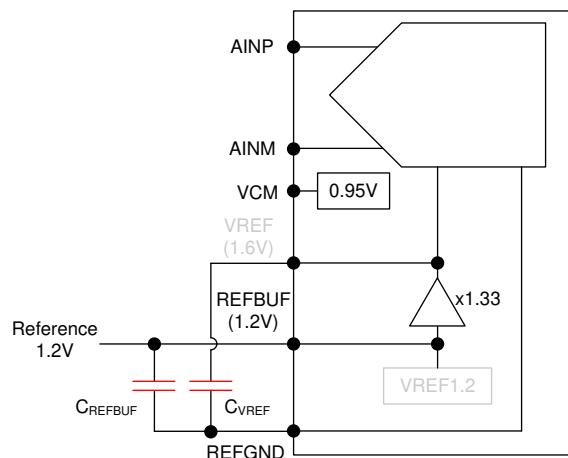

Figure 7-17. External 1.2 V reference using internal reference buffer

7.3.4 Digital Down Converter

The ADC354x includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register setting. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in Figure 7-18. Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise. The output formatter (Section 7.3.5.4) truncates to the selected resolution prior to outputting the data on the digital interface.

Figure 7-18. Internal Digital Decimation Filter

7.3.4.1 Digital Filter Operation

The complex decimation operation is illustrated with an example in Figure 7-19. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz) and the output data rate is decimated - in this example the output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$. During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by 6-dB. In order to compensate this loss, there is a 6-dB digital gain option in the decimation filter block that can be enabled via SPI write.

Figure 7-19. Complex decimation illustration

The real decimation operation is illustrated with an example in Figure 7-20. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated - a decimation of 8 would result in an output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$.

During the real mixing the spectrum (signal and noise) amplitude is reduced by 3-dB. In order to compensate this loss, there is a 3-dB digital gain option in the decimation filter block that can be enabled via SPI write.

Figure 7-20. Real decimation illustration

7.3.4.2 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

$$e^{j\omega n} \text{ (default) or } e^{-j\omega n} \quad (1)$$

where: frequency (ω) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{IN} + f_{NCO}$. The NCO frequency can be tuned from $-F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC354x provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

$$\text{NCO frequency} = 0 \text{ to } +F_S/2: \text{NCO} = f_{NCO} \times 2^{32} / F_S$$

$$\text{NCO frequency} = -F_S/2 \text{ to } 0: \text{NCO} = (f_{NCO} + F_S) \times 2^{32} / F_S$$

where:

- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate $F_S = 65$ MSPS
- Input signal $f_{IN} = 10$ MHz
- Desired output frequency $f_{OUT} = 0$ MHz

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in [Table 7-2](#).

Table 7-2. NCO value calculations example

Alias or negative image	f_{NCO}	NCO Value	Mixer Phase	Frequency translation for f_{OUT}
$f_{IN} = -10$ MHz	$f_{NCO} = 10$ MHz	660764199	as is	$f_{OUT} = f_{IN} + f_{NCO} = -10 \text{ MHz} + 10 \text{ MHz} = 0 \text{ MHz}$
$f_{IN} = 10$ MHz	$f_{NCO} = -10$ MHz	3634203097		$f_{OUT} = f_{IN} + f_{NCO} = 10 \text{ MHz} + (-10 \text{ MHz}) = 0 \text{ MHz}$
$f_{IN} = 10$ MHz	$f_{NCO} = 10$ MHz	660764199	inverted	$f_{OUT} = f_{IN} - f_{NCO} = 10 \text{ MHz} - 10 \text{ MHz} = 0 \text{ MHz}$
$f_{IN} = -10$ MHz	$f_{NCO} = -10$ MHz	3634203097		$f_{OUT} = f_{IN} - f_{NCO} = -10 \text{ MHz} - (-10 \text{ MHz}) = 0 \text{ MHz}$

7.3.4.3 Decimation Filter

The ADC354x supports complex decimation by 2, 4, 8, 16 and 32 with a pass-band bandwidth of ~ 80% and a stopband rejection of at least 85 dB. Table 7-3 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate F_S . In real decimation mode the output bandwidth is half of the complex bandwidth.

Table 7-3. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE ($F_S = 65$ MSPS)	OUTPUT BANDWIDTH ($F_S = 65$ MSPS)
Complex	2	$F_S / 2$ complex	$0.8 \times F_S / 2$	32.5 MSPS complex	26 MHz
	4	$F_S / 4$ complex	$0.8 \times F_S / 4$	16.25 MSPS complex	13 MHz
	8	$F_S / 8$ complex	$0.8 \times F_S / 8$	8.125 MSPS complex	6.5 MHz
	16	$F_S / 16$ complex	$0.8 \times F_S / 16$	4.0625 MSPS complex	3.25 MHz
	32	$F_S / 32$ complex	$0.8 \times F_S / 32$	2.03125 MSPS complex	1.625 MHz
Real	2	$F_S / 2$ real	$0.4 \times F_S / 2$	32.5 MSPS	13 MHz
	4	$F_S / 4$ real	$0.4 \times F_S / 4$	16.25 MSPS	6.5 MHz
	8	$F_S / 8$ real	$0.4 \times F_S / 8$	8.125 MSPS	3.25 MHz
	16	$F_S / 16$ real	$0.4 \times F_S / 16$	4.0625 MSPS	1.625 MHz
	32	$F_S / 32$ real	$0.4 \times F_S / 32$	2.03125 MSPS	0.8125 MHz

The decimation filter responses are normalized to the ADC sampling clock frequency F_S and illustrated in Figure 7-22 to Figure 7-31. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in Figure 7-21. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate F_S .

For example, in the divide-by-4 complex setup, the output data rate is $F_S / 4$ complex with a Nyquist zone of $F_S / 8$ or $0.125 \times F_S$. The transition band (colored in blue) is centered around $0.125 \times F_S$ and the alias transition band is centered at $0.375 \times F_S$. The stop-bands (colored in red), which alias on top of the pass-band, are centered at $0.25 \times F_S$ and $0.5 \times F_S$. The stop-band attenuation is greater than 85 dB.

Figure 7-31. Decimation by 32 complex passband ripple response

7.3.4.4 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in Figure 7-32.

Figure 7-32. External SYNC timing diagram

The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given the internal clock dividers will not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

7.3.4.5 Output Formatting with Decimation

7.3.4.5.1 Parallel CMOS

In parallel CMOS mode, the ADC354x device supports complex decimation output with DDR CMOS interface and real output with SDR and DDR CMOS interface as shown in [Figure 7-33](#) (complex decimation) and [Figure 7-34](#) (real decimation). In this illustration the output format is selected to 16-bit.

Figure 7-33. Output Data Format in Complex Decimation

[Table 7-4](#) illustrates the output interface data rate along with the corresponding DCLK frequency based on complex decimation setting (N).

Furthermore the table shows an actual lane rate example with complex decimation by 4.

Table 7-4. Parallel CMOS Data Rate Examples with Complex Decimation

REAL/COMPLEX DECIMATION	DECIMATION SETTING	ADC SAMPLING RATE	DCLK	DOUT (MHz)
Complex	N	F_S	$F_S \times 2 / N$	$F_S \times 4 / N$
	4	65 MHz	32.5 MHz	65 MHz

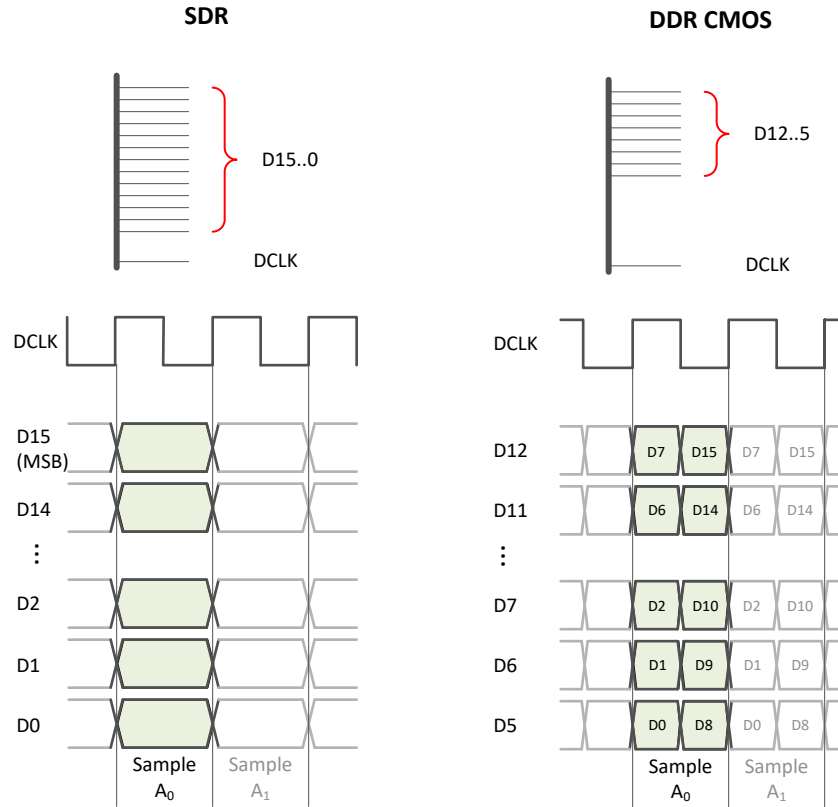

Figure 7-34. Output Data Format in Real Decimation

Table 7-4 illustrates the output interface data rate along with the corresponding DCLK frequency based on real decimation setting (M).

Furthermore the table shows an actual lane rate example with complex decimation by 4.

Table 7-5. Parallel CMOS Data Rate Examples with Decimation

REAL/COMPLEX DECIMATION	DECIMATION SETTING	ADC SAMPLING RATE	SDR/DDR CMOS	DCLK	DOUT
Real	M	F_S	SDR	F_S / M	F_S / M
			DDR		$F_S \times 2 / M$
	4	65 MHz	SDR	16.25 MHz	16.25 MHz
			DDR		32.5 MHz

7.3.4.5.2 Serialized CMOS Interface

In serialized CMOS mode, the ADC354x device supports complex decimation output [Figure 7-35](#) and real decimation output [Figure 7-36](#). The examples are shown for 16-bit output for 2-wire (8x serialization) and 1-wire (16x serialization).

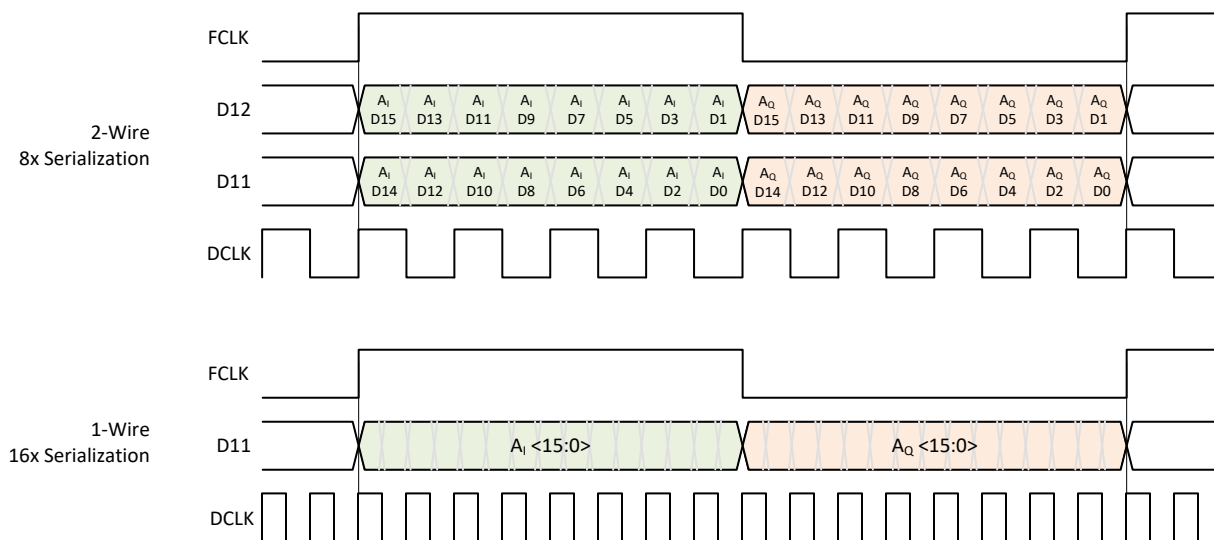

Figure 7-35. Output Data Format in Complex Decimation

[Table 7-6](#) illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and complex decimation setting (N).

Furthermore the table shows an actual lane rate example for the 2- and 1- wire interface, 16-bit output resolution and complex decimation by 16.

Table 7-6. Serial CMOS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
N	F_S	R	L	F_S / N	$[DOUT] / 2$	$F_S \times 2 \times R / L / N$
16	65 MSPS	16	2	4.0625 MHz	32.5 MHz	65 MHz
			1		65 MHz	130 MHz

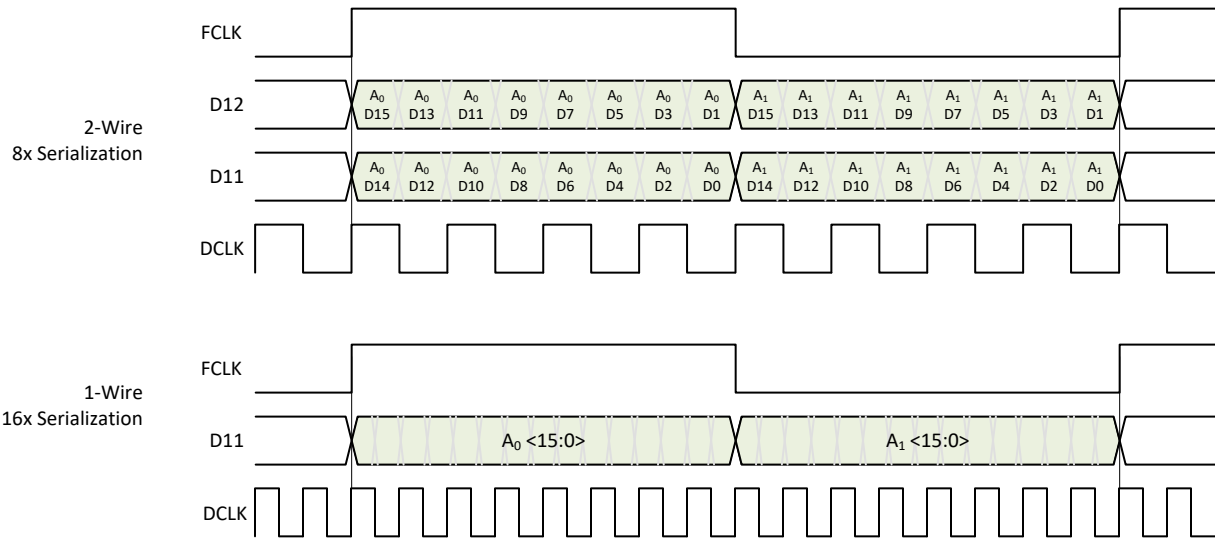

Figure 7-36. Output Data Format in Real Decimation

Table 7-7 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and real decimation setting (M).

Furthermore the table shows an actual lane rate example for the 2- and 1-wire interface, 16-bit output resolution and real decimation by 16.

Table 7-7. Serial CMOS Lane Rate Examples with Real Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
M	F _S	R	L	$F_S / M / 2$ (L = 2) F_S / M (L = 1)	[DOUT] / 2	F _S x R / L / M
16	65 MSPS	16	2	2.03125 MHz	16.25 MHz	32.5 MHz
			1	4.0625 MHz	32.5 MHz	65 MHz

7.3.5 Digital Interface

The ADC354x family supports two different CMOS output modes - parallel SDR/DDR output and serialized CMOS output formats.

7.3.5.1 Parallel CMOS Output

The low power CMOS interface supports single data rate (SDR) and double data rate (DDR) output options. In SDR and DDR output mode the output clock is generated inside the ADC354x. The different interface options are configured using SPI register writes.

7.3.5.2 Serialized CMOS output

In this mode the output data is serialized and transmitted over 2 or 1 wires. Due to CMOS output speed limitation this mode is only available for reduced output data rates. This mode is similar to the multi-SPI interface.

7.3.5.2.1 SDR Output Clocking

The ADC354x provides a SDR output clocking option for all serial CMOS output modes (including decimation) which is enabled using the SPI interface. In serial CMOS mode by default the data is output on rising and falling edge of DCLK. In SDR clocking mode, DCLKIN has to be twice as fast as the default DCLKIN so that the output data are clocked out only on DCLK rising edge.

Internally DCLKIN is divided by 2 for data processing and this operation can add 1 extra clock cycle latency to the ADC latency.

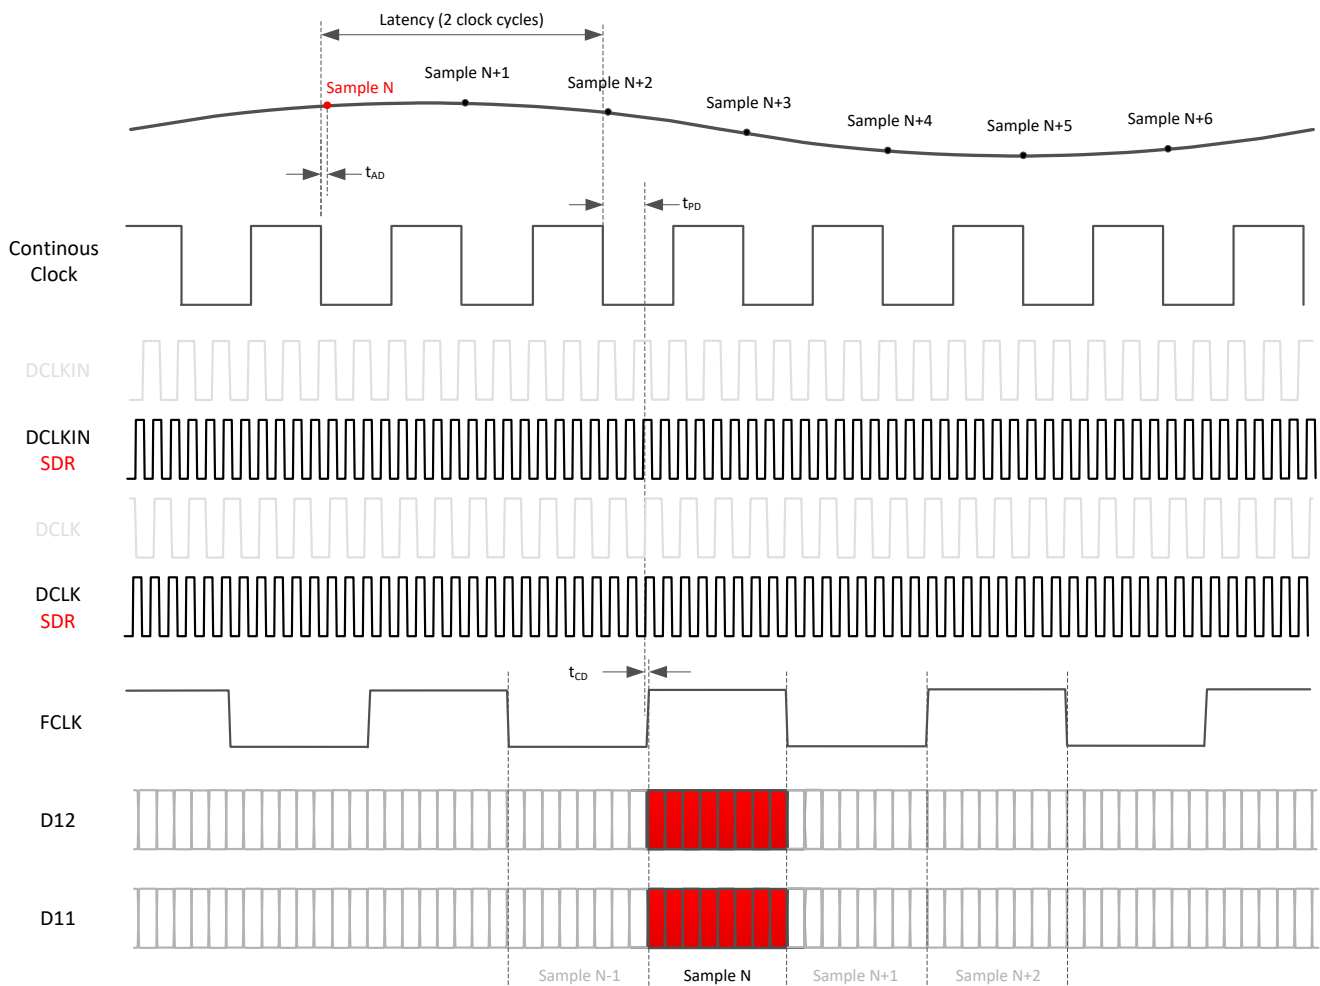

Figure 7-37. SDR Output Clocking

7.3.5.3 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). Table 7-8 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

Table 7-8. Overview of minimum and maximum output codes vs resolution for different formatting

RESOLUTION (BIT)	Two's Complement (default)				Offset Binary			
	14	16	18	20	14	16	18	20
V _{IN,MAX}	0x1FFF	0x7FFF	0x1FFFF	0x7FFFF	0x3FFF	0xFFFF	0x3FFFF	0xFFFFF
0	0x0000		0x00000		0x2000	0x8000	0x20000	0x80000
V _{IN,MIN}	0x2000	0x8000	0x20000	0x80000	0x0000		0x00000	

7.3.5.4 Output Formatter

The digital output interface utilizes a flexible output bit mapper Figure 7-38. The bit mapper takes the 14-bit output directly from the ADC or from digital filter block and reformats it to a resolution of 14, 16, 18 or 20-bit. With parallel output format the maximum output resolution supported is 16-bit. With serial CMOS output the output serialization factor gets adjusted accordingly for 2- and 1-wire interface mode. The maximum output data rate can not be exceeded independently of output resolution and serialization factor.

Figure 7-38. Interface output bit mapper

Table 7-9 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example would result in DCLKIN = F_S * 4 instead of * 3.5.

The output bit mapper can be used for bypass and decimation filter.

Table 7-9. Serialization factor vs output resolution for different output modes

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
14-bit (default)	2-Wire	7x	F _S /2	F _S * 3.5	F _S * 3.5	F _S * 7
	1-Wire	14x	F _S	F _S * 7	F _S * 7	F _S * 14
16-bit	2-Wire	8x	F _S /2	F _S * 4	F _S * 4	F _S * 8
	1-Wire	16x	F _S	F _S * 8	F _S * 8	F _S * 16
18-bit	2-Wire	9x	F _S /2	F _S * 4.5	F _S * 4.5	F _S * 9
	1-Wire	18x	F _S	F _S * 9	F _S * 9	F _S * 18
20-bit	2-Wire	10x	F _S /2	F _S * 5	F _S * 5	F _S * 10
	1-Wire	20x	F _S	F _S * 10	F _S * 10	F _S * 20

The programming sequence to change the output interface and/or resolution from default settings is shown in Section 7.3.5.5.

7.3.5.5 Output Interface/Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

Table 7-10. Configuration steps for changing interface or decimation

STEP	FEATURE	ADDRESS	DESCRIPTION				
1	Output Interface	0x07	Select the output interface bit mapping depending on resolution and output interface.				
			Output Resolution	SDR	DDR	2-wire	1-wire
			14-bit	0xC8	0xA9	0x2B	0x6C
			16-bit			0x4B	
			18-bit	N/A	N/A	0x2B	
20-bit	N/A	N/A	TBD	TBD			
2		0x13	Load the output interface bit mapping using the E-fuse loader (0x13, D0). Program register 0x13 to 0x01, wait ~ 1ms so that bit mapping is loaded properly followed by 0x13 0x00				
3		0x0A/B/C	Power down relevant CMOS output buffers to avoid contention.				
4		0x18	For serial CMOS modes, DCLKIN EN (D4) needs to be enabled.				
5	Output Interface	0x19	In serial CMOS, configure the FCLK registers based on bypass/decimation and # of lanes used.				
			Bypass/Decimation	SCMOS	FCLK SRC (D7)	FCLK DIV (D4)	
			Bypass/ Real Decimation	2-wire	0	1	
				1-wire	0	0	
			Complex Decimation	2-wire	1	0	
1-wire	1	0					
6		0x1B	Select the output interface resolution using the bit mapper (D5-D3).				
7		0x1F	For serial CMOS modes, DCLKIN EN (D6) and DCLK OB EN (D4) need to be enabled.				
8	Output Interface	0x20 0x21 0x22	In serial CMOS, select the FCLK pattern for decimation for proper duty cycle output of the FCLK.				
			Decimation	Output Resolution	2-wire	1-wire	
			Real Decimation	14-bit	use default	0xFE000	
				16-bit		0xFF000	
				18-bit		0xFF800	
			Complex Decimation	14-bit		0xFFFFF	
				16-bit		0xFFFFF	
18-bit	0xFFFFF						
9		0x24	Enable the decimation filter				
10		0x25	Configure the decimation filter				
11		0x2A/B/C/D 0x31/2/3/4	Program the NCO frequency for complex decimation (can be skipped for real decimation)				
12	Decimation Filter	0x27 0x2E	Configure the complex output data stream (set both bits to 0 for real decimation)				
			Serial CMOS	OP-Order (D4)	Q-Delay (D3)		
			2-wire	1	0		
1-wire	0	1					
13		0x26	Set the mixer gain and toggle the mixer reset bit to update the NCO frequency.				

7.3.5.5.1 Configuration Example

The following is a step by step programming example to configure the ADC354x to complex decimation by 8 with 1-wire serial CMOS and 16-bit output.

1. 0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire serial CMOS)
2. 0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
3. 0x0A 0xFF, 0x0B 0xFF, 0x0C 0xFD (power down unused CMOS output buffers to avoid contention)
4. 0x18 0x10 (DCLKIN EN for serial CMOS mode)
5. 0x19 0x82 (configure FCLK)
6. 0x1B 0x0A (select 16-bit output resolution)
7. 0x1F 0x50 (DCLKIN EN for serial CMOS mode)
8. 0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
9. 0x24 0x06 (enable decimation filter)
10. 0x25 0x30 (configure complex decimation by 8)
11. 0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
12. 0x27/0x2E 0x08 (configure Q-delay register bit)
13. 0x26 0xAA, 0x26 0x88 (set digital mixer gain to 6-dB and toggle the mixer update)

7.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). In decimation mode (real and complex), the test patterns replace the output data of the DDC - however channel A controls the test patterns for both channels.

- RAMP Pattern: The step size is set in the CUSTOM PAT register according to the native ADC resolution.
- Custom, constant Pattern

7.3.7 Temperature Sensor

The ADC354x includes an on-chip temperature sensor with a typical accuracy of $\pm 2^{\circ}\text{C}$. The die temperature can be measured and the temperature read out via SPI using the following programming steps (address/data):

1. 0x10 0x04 (enable temperature conversion)
2. 0x08 0x08 (enable temperature sensor)
3. 0x0F 0x03 (configure temperature sensor clock speed)
4. Read back 9-bit temperature value from 0x05 (D0) and 0x06 (D7-D0)

The die temperature is interpreted the following way:

The 9-bit read out value corresponds to the on-chip temperature in $^{\circ}\text{C}$ as illustrated in [Table 7-11](#). The MSB contains the sign bit (+ or -) while the 8 LSBs contain the temperature value. For example 0x019 corresponds to $+25^{\circ}\text{C}$ and 0x119 to -25°C .

Table 7-11. Die temperature register value

DIE TEMP [8:0]								
[8]	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Sign	8-bit die temperature value							

7.4 Device Functional Modes

7.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14-bit resolution. The output is available in as little as 1 clock cycle on the digital CMOS outputs.

7.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21 kΩ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in [Table 7-12](#).

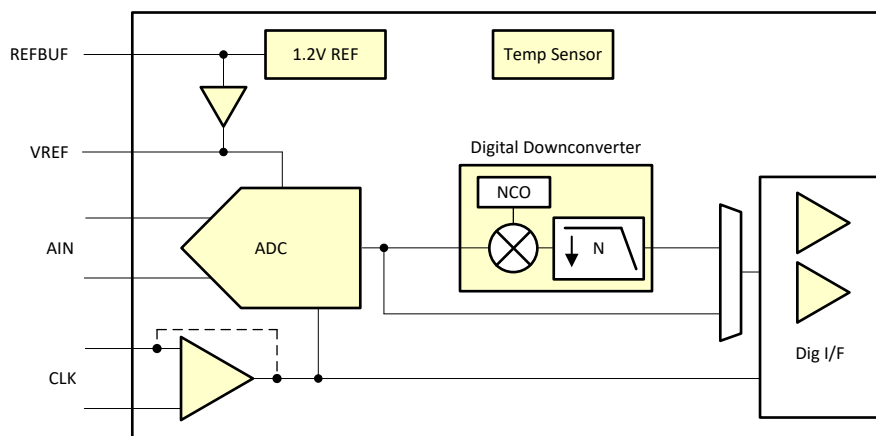

Figure 7-39. Power Down Configurations

Table 7-12. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			ADC is included in Global PDN automatically
Reference gain amplifier	Yes	Yes	Enabled	~ 0.4 mA	~3 us	Should only be powered down in power down state.
Internal 1.2V reference	Yes		External ref	~ 1-3.5 mA	~3 ms	Internal/external reference selection is available through SPI and REFBUF pin.
Clock buffer	Yes		Differential clock	~ 1 mA	n/a	Single ended clock input saves ~ 1 mA compared to differential. Some programmability is available through the REFBUF pin.
Temperature sensor	Yes	-	Disabled	TBD	n/a	
Output interface drivers	Yes	-	Enabled	TBD	n/a	Depending on output interface mode, unused output drivers can be powered down for maximum power savings
REFSYS	Yes	Yes	Enabled	TBD	TBD	Internal bias currents
Decimation filter	Yes	-	Disabled	see electrical table	n/a	

7.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI) however it can operate in a default configuration without requiring the SPI interface. Furthermore the power down function as well as internal/external reference configuration is possible via pin control (PDN/SYNC and REFBUF pin).

Note

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

7.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal 100 kΩ pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating.

Table 7-13. REFBUF voltage levels control voltage reference selection

REFBUF VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION	Digital Interface
> 1.7 V (Default)	External reference	Differential clock input	SDR CMOS
1.2 V (1.15-1.25V)	External 1.2 V input on REFBUF pin using internal gain buffer	Differential clock input	SDR CMOS
0.5 - 0.7V	Internal reference	Differential clock input	SDR CMOS
< 0.1V	Internal reference	Single ended clock input	Serial CMOS 2-wire

7.5.2 Configuration Using the SPI Interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50 % SCLK duty cycle.

7.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 7-40 show the timing requirements for the serial register write operation.

ADC3541

SBAS840A – JULY 2020 – REVISED SEPTEMBER 2020

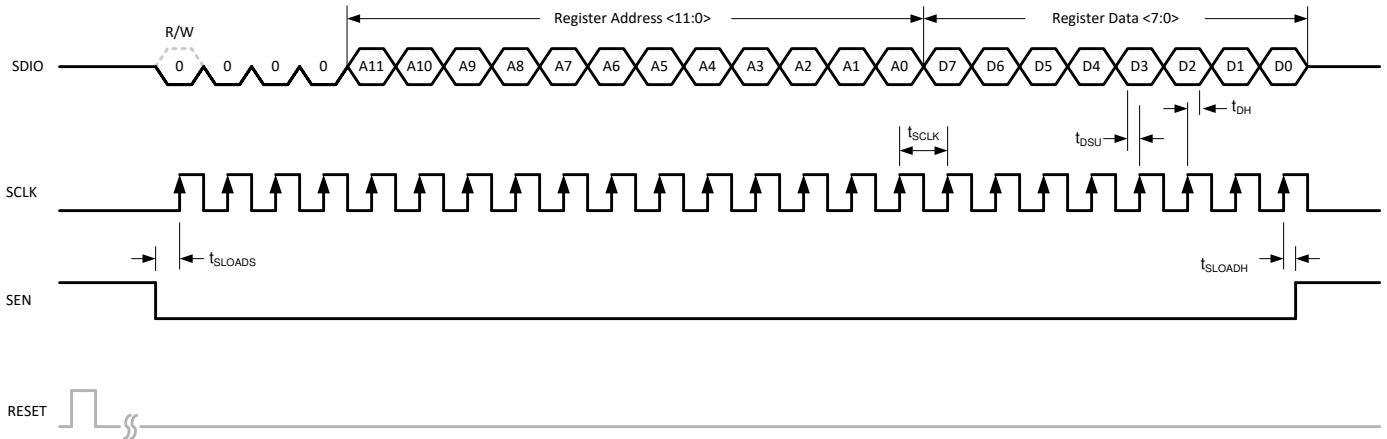

Figure 7-40. Serial Register Write Timing Diagram

7.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device outputs the contents (D[7:0]) of the selected register on the SDIO pin
5. The external controller can latch the contents at the SCLK falling edge

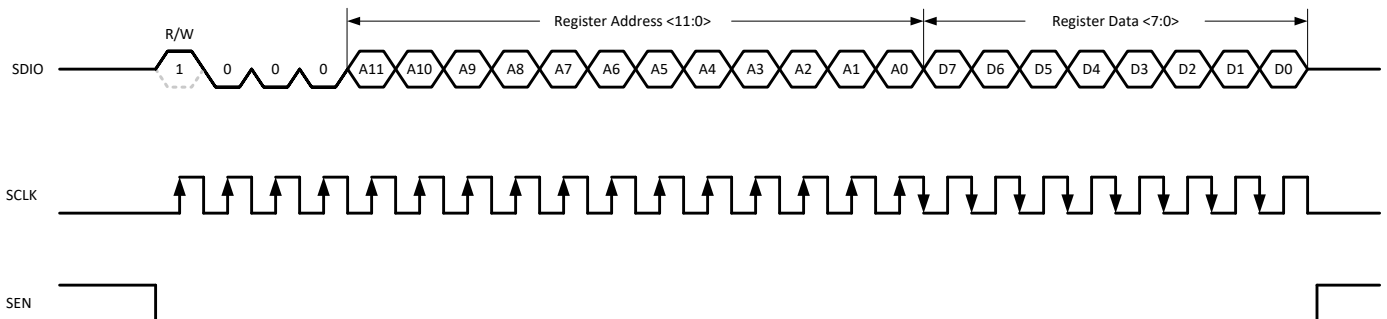

Figure 7-41. Serial Register Read Timing Diagram

Table 7-22. Register 0x0E Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CTRL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	SE A	R/W	0	This bit enables single ended analog input, channel A. In this mode the SNR reduces by 3-dB. 0: Differential input 1: Single ended input.
4-3	0	R/W	0	Must write 0
2	DLL PDN	R/W	0	This register applies ONLY to the ADC3543. It powers down the internal DLL, which is used to adjust the sampling time. This register must be enabled when operating at sampling rates below 40 MSPS. When DLL PDN bit is enabled the sampling time is directly dependent on sampling clock duty cycle (with a 50/50 duty the sampling time is $T_S/2$). 0: Sampling time is $T_S/4$ 1: Sampling time is $T_S/2$ (only for sampling rates below 40 MSPS).
1	0	R/W	0	Must write 0
0	AZ EN	R/W	0/1	This bit enables the internal auto-zero circuitry. It is enabled by default for the ADC3541/42 and disabled for the ADC3543. 0: Auto-zero disabled 1: Auto-zero enabled

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC354x and its front end circuitry is very similar to several other systems such as software defined radio (SDR), sonar, radar or communications. Some applications require frequency coverage including DC or near DC (e.g. sonar) so it's included in this example.

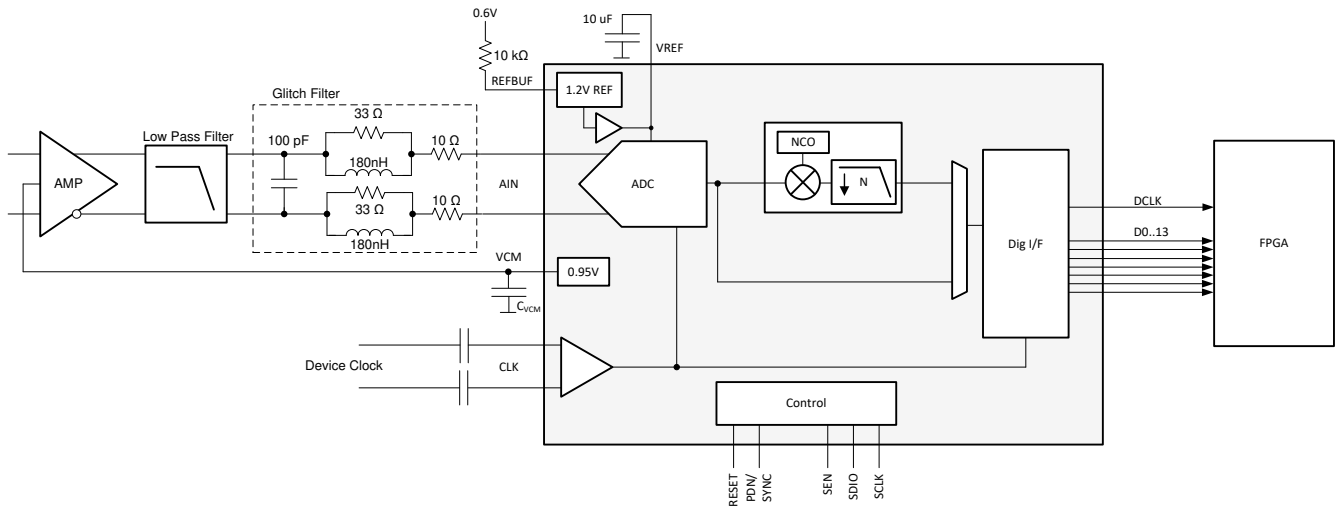

Figure 8-1. Typical configuration for a spectrum analyzer with DC support

8.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If very low input frequency is supported then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed then AC coupling and use of a balun may be more suitable.

The internal reference is used since DC precision is not needed. However the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferers can be present then the ADC SFDR performance will be a key care about as well. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter – an internal decimation filter can be used to reduce the digital output rate afterwards.

Table 8-1. Design key care-about

FEATURE	DESCRIPTION
Signal Bandwidth	DC to 20 MHz
Input Driver	Single ended to differential signal conversion and DC coupling
Clock Source	External clock with low jitter

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC354x input full-scale is 2.25 Vpp. When factoring in ~ 1 dB for insertion loss of the filter, then the amplifier needs to deliver close to 2.5 Vpp. The amplifier distortion performance will degrade with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able to deliver the full swing. The ADC354x provides an output common mode voltage of 0.95V and the THS4541 for

example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply will thus limit the maximum voltage swing to ~ 2.8Vpp. Additionally input voltage protection diodes may be needed to protect the ADC from over-voltage events.

Table 8-2. Output voltage swing of THS4541 vs power supply

DEVICE	MIN OUTPUT VOLTAGE	MAX SWING WITH 3.3 V/ 0 V SUPPLY
THS4541	VS- + 250 mV	2.8 Vpp

8.1.2 Detailed Design Procedure

8.1.2.1 Input Signal Path

Depending on desired input signal frequency range the THS4551 and THS4541 provide very good low power options to drive the ADC inputs. [Table 8-3](#) provides a comparison between the THS4551 and THS4541 and the power consumption vs usable frequency trade off.

Table 8-3. Fully Differential Amplifier Options

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE
THS4561	0.8 mA	< 3 MHz
THS4551	1.4 mA	< 10 MHz
THS4541	10 mA	< 70 MHz

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to be added as well as shown in [Section 7.3.1.2.1](#). In this example the DC - 30 MHz glitch filter is selected.

8.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 20 MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). [Table 8-4](#) provides an overview of the estimated SNR performance of the ADC354x based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC354x thermal noise of 79 dBFS and input signal at -1dBFS.

Table 8-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

INPUT FREQUENCY	T _{J,EXT} = 100 fs	T _{J,EXT} = 250 fs	T _{J,EXT} = 500 fs	T _{J,EXT} = 1 ps
5 MHz	79.0	78.9	78.9	78.8
10 MHz	78.9	78.9	78.7	78.0
20 MHz	78.9	78.6	78.0	75.9

Termination of the clock input should be considered for long clock traces.

8.1.2.3 Voltage Reference

The ADC354x is configured to internal reference operation by applying 0.6 V to the REFBUF pin.

8.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3543 operated at 65 MSPS with a full-scale input at -1 dBFS. The FFT spectrum also shows the response of the low pass filter located between the THS4541 and the glitch filter with a 20 MHz corner frequency.

Graph Placeholder

Figure 8-2.

8.2 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 8-3.

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in ~ 2ms.
2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

Figure 8-3. Initialization of serial registers after power up

Table 8-5. Power-up timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay: delay from power up to logic level of REFBUF pin	2			ms
t_2	Delay from REFBUF pin logic level to RESET rising edge	100			ns
t_4	RESET pulse width	1			us
t_5	Delay from RESET disable to SEN active	~ 200000			clock cycles

8.2.1 Register Initialization

If required, the serial interface registers can be cleared and reset to default settings during operation either:

- through a hardware reset
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

9 Power Supply Recommendations

The ADC354x requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise in order to achieve data sheet performance. In applications operating near DC, the $1/f$ noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aids with the power supply filter design.

Figure 9-1. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to ensure switching noise is minimized to prevent degraded ADC performance.

TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. [Figure 9-2](#) and [Figure 9-3](#) illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.

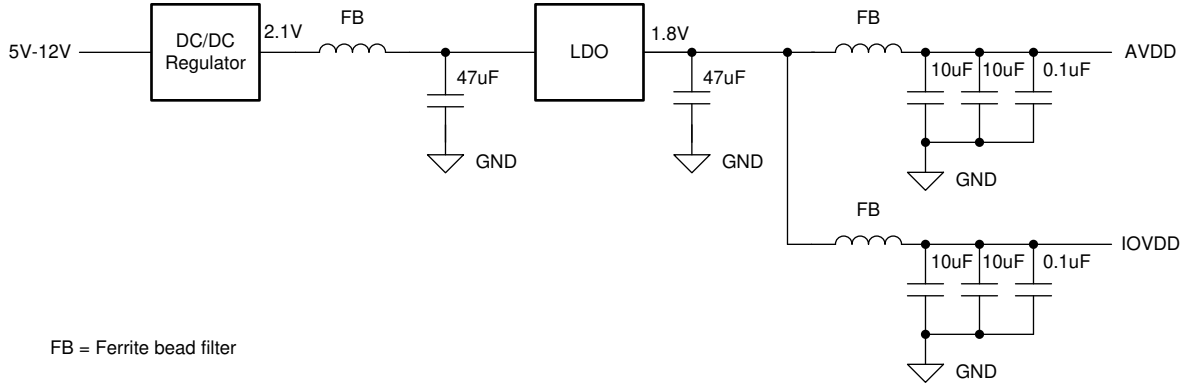

Figure 9-2. Example: LDO Linear Regulator Approach

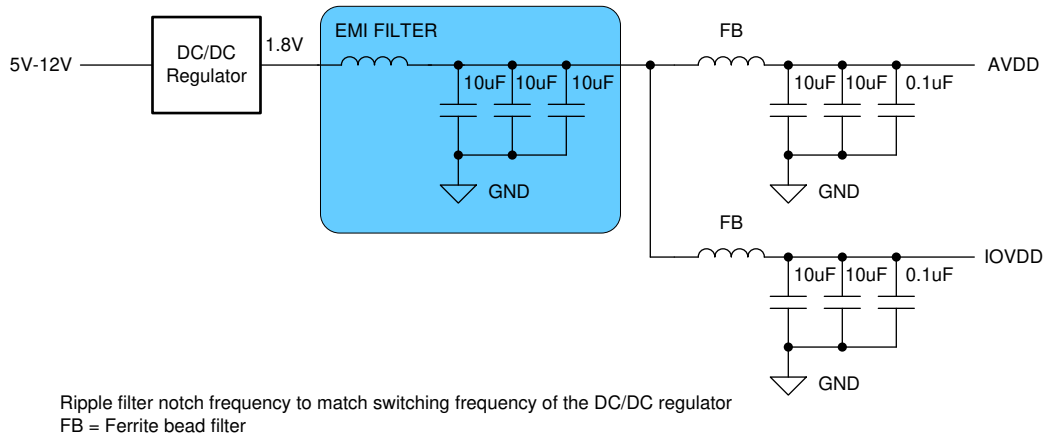

Figure 9-3. Example Switcher-Only Approach

10 Layout

10.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
 - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
 - Traces should be routed using loosely coupled 100- Ω differential traces.
 - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital output interface
 - A TBD ohm series isolation resistor should be used on each CMOS output and placed close the digital output. This isolation resistor limits the output current into the capacitive load and thus minimizes the switching noise inside the ADC. When driving longer distances a buffer should be used. The resistor value should be optimized for the desired output data rate.
3. Voltage reference
 - The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND – on top layer avoiding vias.
 - Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.
4. Power and ground connections
 - Provide low resistance connection paths to all power and ground pins.
 - Use power and ground planes instead of traces.
 - Avoid narrow, isolated paths which increase the connection resistance.
 - Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

10.2 Layout Example

The following screen shot shows the top layer of the ADC354x EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- CMOS output interface lanes with isolation resistor and digital buffer.
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

11 Device and Documentation Support

11.1 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.2 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.4 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PADC3541IRSBT	ACTIVE	WQFN	RSB	40	250	Non-RoHS & Non-Green	Call TI	Call TI	-40 to 105		Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=100ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
