

AM243x Sitara™ Microcontrollers

1 Features

Processor cores:

- Up to 2× Dual-core Arm® Cortex®-R5F MCU subsystems operating at up to 800 MHz, highly-integrated for real-time processing
 - Dual-core Arm® Cortex®-R5F clusters support dual-core and single-core operation
 - 32KB ICache and 32KB DCache per R5F core with SECDED ECC on all memories
 - Single-core: 128KB TCM per cluster (128KB TCM per R5F core)
 - Dual-core: 128KB TCM per cluster (64KB TCM per R5F core)
- 1× Single-core Arm® Cortex®-M4F MCU subsystem at up to 400 MHz
 - 256KB SRAM with SECDED ECC

Memory subsystem:

- Up to 2MB of On-chip RAM (OCSRAM) with SECDED ECC:
 - Can be divided into smaller banks in increments of 256KB for as many as 8 separate memory banks
 - Each memory bank can be allocated to a single core to facilitate software task partitioning
- DDR Subsystem (DDRSS)
 - Supports LPDDR4, DDR4 memory types
 - 16-Bit data bus with inline ECC
 - Supports speeds up to 1600 MT/s

Industrial subsystem:

- 2× Gigabit Industrial Communication Subsystems (PRU_ICSSG)
 - Optional support for Profinet IRT, Profinet RT, EtherNet/IP, EtherCAT, Time-Sensitive Networking (TSN), and other Networking Protocols
 - Backwards compatibility with 10/100Mb PRU_ICSS
 - Each PRU_ICSSG contains:
 - 3× PRU RISC Cores per Slice (2× Slice per PRU_ICSSG)
 - PRU General Use core (PRU)
 - PRU Real-Time Unit core (PRU-RTU)
 - PRU Transmit core (PRU-TX)
 - Each PRU core supports the following features:
 - Instruction RAM with ECC
 - Broadside RAM

- Multiplier with optional accumulator (MAC)
- CRC16/32 hardware accelerator
- Byte swap for Big/Little Endian conversion
- SUM32 hardware accelerator for UDP checksum
- Task Manager for preemption support
- Up to 2× 10/100/1000 Ethernet ports
- Three Data RAMs with ECC
- 8 banks of 30 × 32-bit register scratchpad memory
- Interrupt controller and task manager
- 2× 64-bit Industrial Ethernet Peripherals (IEPs) for time stamping and other time synchronization functions
- 18× Sigma-Delta filters
 - Short circuit logic
 - Over-current logic
- 6× Multi-protocol position encoder interfaces
- One Enhanced Capture Module (ECAP)
- 16550-compatible UART with a
 - Dedicated 192-MHz clock to support 12-Mbps PROFIBUS

System on Chip (SoC) Services:

- Device Management Security Controller (DMSC-L)
 - Centralized SoC system controller
 - Manages system services including initial boot, security, and clock/reset/power management
 - Communication with various processing units over message manager
 - Simplified interface for optimizing unused peripherals
 - On-Chip Debug functionality through JTAG and Trace interfaces)
- Data Movement Subsystem (DMSS)
 - Block Copy DMA (BCDMA)
 - Packet DMA (PKTDMA)
 - Secure Proxy (SEC_PROXY)
 - Ring Accelerator (RINGACC)
- Time Sync Subsystem
 - Central Platform Time Sync (CPTS) module
 - Timer Manager (TIMERMANAGER) with 1024 timers
 - Time Sync and Compare event interrupt routers

Security:

- Secure Boot supported
 - Hardware-enforced Root-of-Trust (RoT)
 - Support to switch RoT via backup key

- Support for takeover protection, IP protection, and anti-roll back protection
- Support for cryptographic acceleration
 - Session-aware cryptographic engine with ability to auto-switch key-material based on incoming data stream
 - Supports cryptographic cores
 - AES – 128/192/256 Bits key sizes
 - 3DES – 56/112/168 Bits key sizes
 - MD5, SHA1
 - SHA2 – 224/256/384/512
 - DRBG with true random number generator
 - PKA (Public Key Accelerator) to Assist in RSA/ECC processing
 - DMA support
- Debugging security
 - Secure software controlled debug access
 - Security aware debugging
- Trusted Execution Environment (TEE) supported
 - Arm TrustZone® based TEE
 - Extensive firewall support for isolation
 - Secure DMA Path and Interconnect
 - Secure watchdog/timer/IPC
- Secure storage support
- On-the-Fly encryption (OTFE) support for OSPI interface in XIP mode
- Networking security support for data (Payload) encryption/authentication via packet based hardware cryptographic engine
- Security co-processor (DMSC-L) for key and security management, with dedicated device level interconnect for security

High-speed serial interfaces:

- 1× Integrated Ethernet switch supporting up to 2 external ports (CPSW3G)
 - Up to 2 RGMII (10/100/1000)
 - IEEE 1588 (2008 Annex D, Annex E, Annex F) with 802.1AS PTP
 - Clause 45 MDIO PHY management
 - Energy efficient Ethernet (802.3az)
- 1× PCI-Express® Gen2 controller (PCIE)
 - Supports Gen2 operation
 - Supports Single Lane operation
- 1× USB 3.1-Gen1 Dual-role Device (DRD) Subsystem (USBSS)
 - One shared USBSS port for enhanced SuperSpeed Gen1 or USB 2.0
 - Port configurable as USB host, USB peripheral, or USB Dual-role Device
 - Integrated USB VBUS detection
- 1× Serializer/Deserializer (SERDES)
 - One SERDES lane to support PCI-Express® Gen2 and USB SuperSpeed Gen1

General connectivity peripherals:

- 6× Inter-Integrated Circuit (I2C) ports
- 9× configurable Universal Asynchronous Receive/Transmit (UART) modules
- 1× 12-bit Analog-to-Digital Converters (ADC)
 - Up to 4 MSPS
 - 8× multiplexed analog inputs
- 7× Multichannel Serial Peripheral Interfaces (MCSPI) controllers
- 3× General-Purpose I/O (GPIO) modules

Industrial and control interfaces:

- 9× Enhanced Pulse-Width Modulator (EPWM) modules
- 3× Enhanced Capture (ECAP) modules
- 3× Enhanced Quadrature Encoder Pulse (EQEP) modules
- 2× Modular Controller Area Network (MCAN) modules with full CAN-FD support
- 2× Fast Serial Interface Transmitter (FSI_TX) cores
- 6× Fast Serial Interface Receiver (FSI_RX) cores

Memory controllers:

- 2× MultiMedia Card/Secure Digital (MMC/SD) interfaces
 - One 4-bit for SD/SDIO
 - One 8-bit for eMMC
 - Integrated analog switch for voltage switching between 3.3V to 1.8V for high-speed cards
- 1× General-Purpose Memory Controller (GPMC)
 - 16-bit parallel bus with 133 MHz clock or
 - 32-bit parallel bus with 100 MHz clock
 - Error Location Module (ELM) support
- 1× Flash Subsystem (FSS) that can be configured as Octal SPI (OSPI) flash interfaces or one Quad SPI (QSPI)

Power Management:

- Simplified power sequence
- Dual-voltage I/O Support
- Integrated SDIO LDO for handling automatic voltage transition for SD interface
- Integrated voltage supervisor for safety monitoring of over-under voltage conditions
- Integrated power supply glitch detector for detecting fast supply transients

Functional Safety:

- **Functional Safety-Compliant** Targeted
 - Developed for functional safety applications
 - Documentation will be available to aid IEC 61508 functional safety system design
 - Systematic capability up to SIL 3
 - Hardware integrity up to SIL 2 targeted for MCU domain
 - Quality-managed MAIN Domain
 - Safety-related certification
 - IEC 61508 certification planned
 - ECC or parity on calculation-critical memories
 - ECC and parity on select internal bus interconnects
 - Built-In Self-Test (BIST) for CPU and on-chip RAM
 - Error Signaling Module (ESM) with external error pin
 - Run-time safety diagnostics, including:
 - Voltage, Temperature, and Clock Monitoring
 - Windowed Watchdog Timers
 - CRC Engine for memory integrity checks
 - MCU Domain with dedicated memory, interfaces, and M4FSS capable of being isolated from the larger SoC with Freedom From Interference (FFI) features
 - Separate interconnect
 - Firewalls and timeout gaskets
 - Dedicated PLL
 - Dedicated I/O supply
 - Separate reset

SoC Architecture:

- Supports primary boot from UART, I2C, OSPI/QSPI Flash, SPI Flash, parallel NOR Flash, parallel NAND Flash, SD, eMMC, USB 2.0, PCIe, and Ethernet interfaces
- 16-nm FinFET technology

Package options:

- ALV FCBGA (441-pin) (Lidded) Flip-Chip Ball Grid Array package, 17.2 mm × 17.2 mm, 0.8-mm pitch
- ALX FC/CSP (293-pin) (SiP) Flip-Chip Chip Scale Package package, 11 mm × 11 mm, 0.5-mm pitch

3 Description

AM243x is an extension of Sitara's industrial-grade portfolio into high-performance microcontrollers. The AM243x device is built for industrial applications, such as motor drives and remote I/O modules, which require a combination of real-time communications and processing. The AM243x family provides scalable performance with up to four Cortex-R5F MCUs and one Cortex-M4F.

The AM243x SoC architecture was designed to provide best-in-class real-time performance through the high-performance Arm Cortex-R5F cores, Tightly-Coupled Memory banks, configurable SRAM partitioning, and dedicated low-latency paths to and from peripherals for rapid data movement in and out of the SoC. This deterministic architecture allows for AM243x to handle the tight control loops found in servo drives while the peripherals like FSI, GPMC, PWMs, sigma delta decimation filters, and absolute encoder interfaces help enable a number of different architectures found in these systems.

The PRU-ICSSG in AM243x provides the flexible industrial communications capability necessary to run gigabit TSN, EtherCAT, PROFINET, EtherNet/IP, and various other protocols. In addition, the PRU-ICSSG also enables additional interfaces in the SoC including sigma delta decimation filters and absolute encoder interfaces.

Functional safety features can be enabled through the integrated Cortex-M4F along with its dedicated peripherals which can all be isolated from the rest of the SoC. AM243x also supports secure boot.

- (1) Features noted as “not supported” or “-”, must not be used. Their functionality is not supported by TI for this family of devices. These features are subject to removal without notice on future device revisions. Any information regarding the unsupported features has been retained in the documentation solely for the purpose of clarifying signal names or for consistency with previous feature descriptions.
- (2) For more details about the CTRLMMR_JTAG_DEVICE_ID register and DEVICE_ID bit field, see the device's associated *Technical Reference Manual*.
- (3) The R5F cores share Tightly Coupled Memory within a cluster and can be allocated per system requirements.
- (4) One simultaneous flash interface configured as OSPI0 or QSPI0.
- (5) Only the A output signal is available for the EHRPWM5 instance of the ALX package type.

ADVANCE INFORMATION

6.2 Pin Attributes (ALV Package)

The following list describes the contents of each column in the *Pin Attributes* table:

1. **BALL NUMBER:** Ball numbers assigned to each terminal of the Ball Grid Array package.
2. **BALL NAME:** Ball name assigned to each terminal of the Ball Grid Array package (this name is typically taken from the primary MUXMODE 0 signal function).
3. **SIGNAL NAME:** Signal name(s) of all dedicated and pin multiplexed signal functions associated with a ball.

Note

The *Pin Attributes* table, defines the pin multiplexed signal functions implemented at the pin and does not define secondary multiplexing of signal functions implemented in device subsystems. Secondary multiplexing of signal functions are not described in this table. For more information on secondary multiplexed signal functions, see the respective peripheral chapter of the device TRM.

4. **MUX MODE:** The MUXMODE value associated with each pin multiplexed signal function:
 - a. MUXMODE 0 is the primary pin multiplexed signal function. However, the primary pin multiplexed signal function is not necessarily the default pin multiplexed signal function.

Note

The value found in the MUX MODE AFTER RESET column defines the default pin multiplexed signal function selected when MCU_PORz is deasserted.

- b. MUXMODE values 1 through 15 are possible for pin multiplexed signal functions. However, not all MUXMODE values have been implemented. The only valid MUXMODE values are those defined as pin multiplexed signal functions within the Pin Attributes table. Only valid values of MUXMODE should be used.
 - c. Bootstrap defines SOC configuration pins, where the logic state applied to each pin is latched on the rising edge of PORz_OUT. These input signal functions are fixed to their respective pins and are not programmable via MUXMODE.
 - d. An empty box or "-" means Not Applicable.
5. **TYPE:** Signal type and direction:
 - I = Input
 - O = Output
 - IO = Input, Output, or simultaneously Input and Output
 - IOD = Input, Output, or simultaneously Input and Output, with open-drain output function
 - IOZ = Input, Output, or simultaneously Input and Output, with three-state output function
 - OZ = Output with three-state output function
 - A = Analog
 - PWR = Power
 - GND = Ground
 - CAP = LDO Capacitor.

6. **DSIS:** The deselected input state (DSIS) indicates the state driven to the subsystem input (logic "0", logic "1", or "pad" level) when the pin multiplexed signal function is not selected by MUXMODE.
 - 0: Logic 0 driven to the subsystem input.
 - 1: Logic 1 driven to the subsystem input.
 - pad: Logic state of the pad is driven to the subsystem input.
 - An empty box or "-" means Not Applicable.
7. **BALL STATE DURING RESET (RX/TX/PULL):** State of the terminal while MCU_PORz is asserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
 - RX (Input buffer)
 - Off: The input buffer is disabled.
 - On: The input buffer is enabled.
 - TX (Output buffer)
 - Off: The output buffer is disabled.
 - Low: The output buffer is enabled and drives V_{OL} .
 - PULL (Internal pull resistors)
 - Off: Internal pull resistors are turned off.
 - Up: Internal pull-up resistor is turned on.
 - Down: Internal pull-down resistor is turned on.
 - An empty box or "-" means Not Applicable.
8. **BALL STATE AFTER RESET (RX/TX/PULL):** State of the terminal after MCU_PORz is deasserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
 - RX (Input buffer)
 - Off: The input buffer is disabled.
 - On: The input buffer is enabled.
 - TX (Output buffer)
 - Off: The output buffer is disabled.
 - SS: The subsystem selected with MUXMODE determines the output buffer state.
 - PULL (Internal pull resistors)
 - Off: Internal pull resistors are turned off.
 - Up: Internal pull-up resistor is turned on.
 - Down: Internal pull-down resistor is turned on.
 - An empty box or "-" means Not Applicable.
9. **MUX MODE AFTER RESET:** The value found in this column defines the default pin multiplexed signal function after MCU_PORz is deasserted. An empty box means Not Applicable.
10. **I/O VOLTAGE VALUE:** This column describes I/O operating voltage options of the respective power supply, when applicable. An empty box or "-" means Not Applicable.

For more information, see valid operating voltage range(s) defined for each power supply in *Recommended Operating Conditions*.
11. **POWER:** The power supply of the associated I/O, when applicable.

An empty box or "-" means Not Applicable.

12. **HYS:** Indicates if the input buffer associated with this I/O has hysteresis:
- Yes: With hysteresis
 - No: Without hysteresis
 - An empty box or "-" means Not Applicable.

For more information, see the hysteresis values in *Electrical Characteristics*.

13. **BUFFER TYPE:** This column defines the buffer type associated with a terminal. This information can be used to determine which Electrical Characteristics table is applicable.

An empty box or "-" means Not Applicable.

For electrical characteristics, refer to the appropriate buffer type table in *Electrical Characteristics*.

14. **PULL UP/DOWN TYPE:** Indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
- PU: Internal pull-up
 - PD: Internal pull-down
 - PU/PD: Internal pull-up and pull-down
 - An empty box or "-" means No internal pull.

Note

Configuring two pins to the same pin multiplexed signal function is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration.

Note

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

6.4 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

The following list describes the column headers:

1. **SIGNAL NAME:** The name of the signal passing through the pin.

Note

Signal names and descriptions provided in each Signal Descriptions table, represent the pin multiplexed signal function which is implemented at the pin and selected via PADCONFIG registers. Device subsystems may provide secondary multiplexing of signal functions, which are not described in these tables. For more information on secondary multiplexed signal functions, see the respective peripheral chapter of the device TRM.

2. **PIN TYPE:** Signal direction and type:
 - I = Input
 - O = Output
 - IO = Input, Output, or simultaneously Input and Output
 - IOD = Input, Output, or simultaneously Input and Output with open-drain output function
 - IOZ = Input, Output, or simultaneously Input and Output with three-state output function
 - OZ = Output with three-state output function
 - A = Analog
 - PWR = Power
 - GND = Ground
 - CAP = LDO Capacitor
3. **DESCRIPTION:** Description of the signal
4. **BALL:** Associated ball number

For more information on the I/O cell configurations, see the *Pad Configuration Registers* section in *Device Configuration* chapter of the device TRM.

Note

The following peripheral instances and signals **are not supported** by the AM243x_ALX device package. In some cases, the entire peripheral can not be used due to critical interface signal availability.

- (1) To determine which power supply is associated with any IO refer to the *Pin Attributes* tables.

Note

All power balls must be supplied with the voltages specified in [Section 7.4, Recommended Operating Conditions](#), unless otherwise specified in [Section 6.4, Signal Descriptions](#).

Note

All other unused signal balls **with** a Pad Configuration register can be left unconnected with their multiplexing mode set to GPIO input and internal pulldown resistor enabled.

Unused balls are defined as those which only connect to a PCB solder pad. This is the only use case where internal pull resistors are allowed as the only source/sink to hold a valid logic level.

Any balls connected to a via, test point, or PCB trace are considered used and must not depend on the internal pull resistor to hold a valid logic level.

Internal pull resistors are weak and may not source enough current to maintain a valid logic level for some operating conditions. This may be the case when connected to components with leakage to the opposite logic level, or when external noise sources couple to signal traces attached to balls which are only pulled to a valid logic level by the internal resistor. Therefore, external pull resistors may be required to hold a valid logic level on balls with external connections.

If balls are allowed to float between valid logic levels, the input buffer may enter a high-current state which could damage the IO cell.

Note

All other unused signal balls **without** a Pad Configuration register should be left unconnected.

Table 7-1. Absolute Maximum Ratings (continued)

PARAMETER		MIN	MAX	Unit
T _{STG}	Storage temperature	-55	+150	°C

- (1) This parameter applies to all IO pins which are not fail-safe and the requirement applies to all values of IO supply voltage. For example, if the voltage applied to a specific IO supply is 0 volts the valid input voltage range for any IO powered by that supply will be –0.3 to +0.3 volts. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.
- (2) The VMON_VSYS pin provides a way to monitor the system power supply. For more information, see [Section 9.3.5, System Power Supply Monitor Design Guidelines](#).
- (3) VDD is the voltage on the corresponding power-supply pin(s) for the IO.
- (4) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 9.3.4, USB Design Guidelines](#).

Fail-safe IO terminals are designed such they do not have dependencies on the respective IO power supply voltage. This allows external voltage sources to be connected to these IO terminals when the respective IO power supplies are turned off. The MCU_I2C0_SCL, MCU_I2C0_SDA, I2C0_SCL, I2C0_SDA, EXTINTn, VMON_1P8_MCU, VMON_1P8_SOC, VMON_3P3_MCU, VMON_3P3_SOC, and MCU_PORz are the only fail-safe IO terminals. All other IO terminals are not fail-safe and the voltage applied to them should be limited to the value defined by the Steady State Max. Voltage at all IO pins parameter in [Section 7.1](#).

- (1) This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.
- (2) Unless specified in the table above, all voltage domains and operating conditions are supported in the device at the noted temperatures.
- (3) POH is a function of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH.

- (1) The VMON_VSYS pin provides a way to monitor the system power supply. For more information, see [Section 9.3.5, System Power Supply Monitor Design Guidelines](#).
- (2) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 9.3.4, USB Design Guidelines](#).
- (3) The voltage at the device ball must never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, and so forth.

7.5 Operating Performance Points

This section describes the operating conditions of the device. This section also contains the description of each Operating Performance Point (OPP) for processor clocks and device core clocks.

Note

The OPP voltage and frequency values may change following the silicon characterization result.

Table 7-2 describes the maximum supported frequency per speed grade for the device.

Table 7-2. Speed Grade Maximum Frequency

DEVICE ⁽¹⁾	MAXIMUM FREQUENCY (MHz)

(1) N/A in this table stands for Not Applicable.

(2) Maximum DDR Frequency will be limited based on the specific memory type (vendor) used in a system and by PCB implementation.

7.6 Power Consumption Summary

For information on the device power consumption contact your TI Representative.

7.7 Electrical Characteristics

Note

The interfaces or signals described in the following Electrical Characteristics tables correspond to the interfaces or signals available when the associated PADCONFIG register is configured for multiplexing mode 0 (Primary Function).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a combined PHY and GPIO topology. In this case, different DC electrical characteristics are specified for the different multiplexing modes (Functions).

7.7.8 USB2PHY Electrical Characteristics

Note

USB0 interface is compliant with Universal Serial Bus Revision 2.0 Specification dated April 27, 2000 including ECNs and Errata as applicable.

7.7.9 DDR Electrical Characteristics

Note

The DDR interface is compatible with DDR4 and LPDDR4 devices

7.8 VPP Specifications for One-Time Programmable (OTP) eFuses

This section specifies the operating conditions required for programming the OTP eFuses..

7.8.1 Recommended Operating Conditions for OTP eFuse Programming

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
VDD_CORE	Supply voltage range for the core domain during OTP operation; OPP NOM (BOOT)	See <i>Recommended Operating Conditions</i>			V
VPP	Supply voltage range for the eFuse ROM domain during normal operation without hardware support to program eFuse ROM	NC ⁽²⁾			V
	Supply voltage range for the eFuse ROM domain during normal operation with hardware support to program eFuse ROM	0			V
	Supply voltage range for the eFuse ROM domain during OTP programming ⁽¹⁾	1.71	1.8	1.89	V
I _(VPP)	VPP current	TBD			mA
SR _(VPP)	VPP Slew Rate	6E + 4			V/s
Tj	Temperature (ambient)	0	25	85	°C

(1) Supply voltage range includes DC errors and peak-to-peak noise. TI power management solutions [TLV70718](#) from the TLV707x family is a example device that meets the supply voltage range needed for VPP.

(2) NC stands for No Connect.

7.8.2 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The VPP power supply must be disabled when not programming OTP registers.
- The VPP power supply must be ramped up after the proper device power-up sequence (for more details, see [Section 7.10.2, Power Supply Sequencing](#)).

7.8.3 Programming Sequence

Programming sequence for OTP eFuses:

- Power on the board per the power-up sequencing. No voltage should be applied on the VPP terminal during power up and normal operation.
- Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
- Apply the voltage on the VPP terminal according to the specification in [Section 7.8.1](#).
- Run the software that programs the OTP registers.
- After validating the content of the OTP registers, remove the voltage from the VPP terminal.

7.8.4 Impact to Your Hardware Warranty

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse. CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

7.9 Thermal Resistance Characteristics

This section provides the thermal resistance characteristics used on this device.

For reliability and operability concerns, the maximum junction temperature of the device has to be at or below the T_J value identified in *Recommended Operating Conditions*.

7.9.1 Thermal Resistance Characteristics

Table 7-3. ALV Package Thermal Resistance Characteristics

It is recommended to perform thermal simulations at the system level with the worst case device power consumption.

(2) m/s = meters per second.

(3) °C/W = degrees Celsius per watt.

7.10 Timing and Switching Characteristics

Note

The Timing Requirements and Switching Characteristics values may change following the silicon characterization result.

Note

The default SLEWRATE settings in each pad configuration register must be used to ensure timings, unless specific instructions are given otherwise.

7.10.1 Timing Parameters and Information

The timing parameter symbols used in *Timing and Switching Characteristics* sections are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies have been abbreviated in [Table 7-4](#):

Table 7-4. Timing Parameters Subscripts

SYMBOL	PARAMETER
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

7.10.2 Power Supply Sequencing

This section describes power supply sequencing required to ensure proper device operation. The power supply names described in this section comprise a superset of a family of compatible devices. Some members of this family will not include a subset of these power supplies and their associated device modules.

Note

All power sequence timing shown is preliminary and under evaluation. Updates will be provided as details become known during validation testing.

7.10.2.1 Power Supply Slew Rate Requirement

To maintain the safe operating range of the internal ESD protection devices, TI recommends limiting the maximum slew rate of supplies to be less than 18 mV/μs. For instance, as shown in [Figure 7-2](#), TI recommends having the supply ramp slew for a 1.8-V supply of more than 100 μs.

[Figure 7-2](#) describes the Power Supply Slew Rate Requirement in the device.

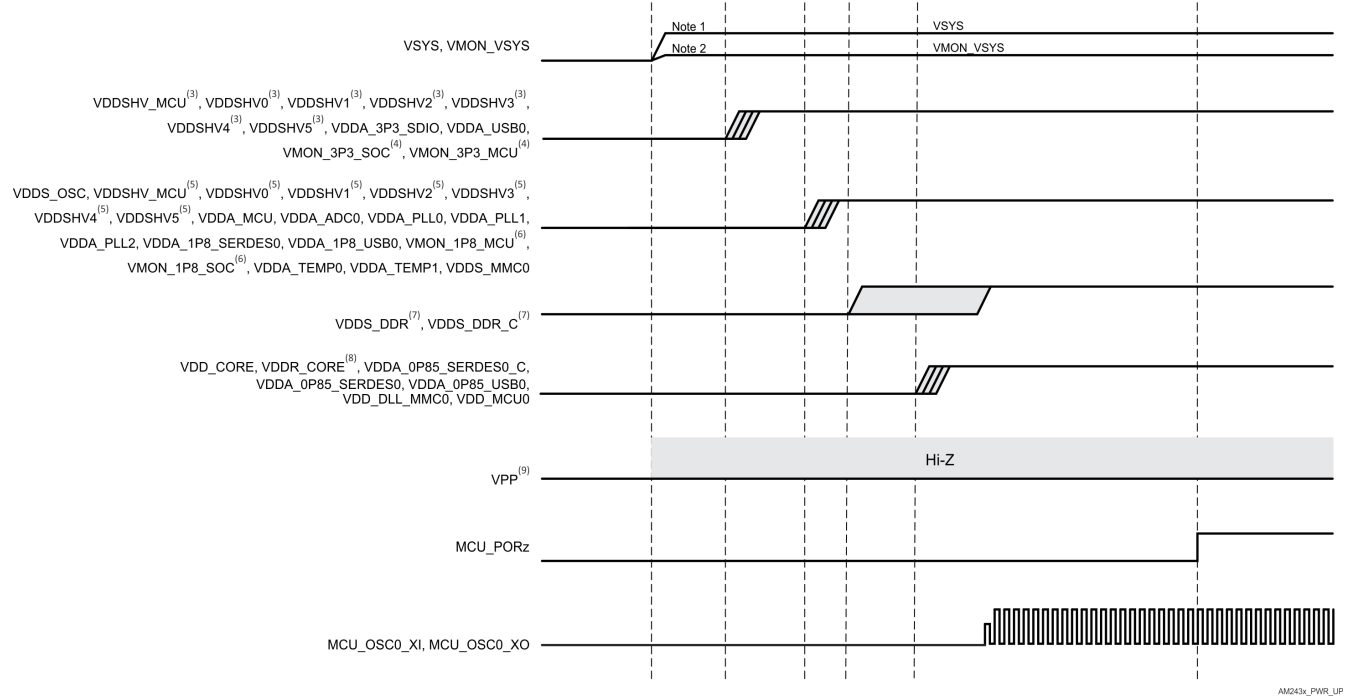

Figure 7-2. Power Supply Slew and Slew Rate

7.10.2.2 Power-Up Sequencing

The [Figure 7-3](#) diagram describes the device power-up sequencing.

Figure 7-3. Power-Up Sequencing

1. VSYS represents the name of a supply which sources power to the entire system. This supply is expected to be a pre-regulated supply that sources power management devices which source all other supplies.
2. VMON_VSYS input is used to monitor VSYS via an external resistor divider circuit. For more information, see [Section 9.3.5, System Power Supply Monitor Design Guidelines](#).
3. VDDSHV_MCU and VDDSHVx [x=0-5] are dual voltage IO supplies which can be operated at 1.8V or 3.3V depending on the application requirements. When any of the VDDSHV_MCU or VDDSHVx [x=0-5] IO supplies are operating at 3.3V, they shall be ramped up with other 3.3V supplies during the 3.3V ramp period defined by this waveform.
4. The VMON_3P3_MCU and VMON_3P3_SOC inputs are used to monitor supply voltage and shall be connected to the respective 3.3V supply source.
5. VDDSHV_MCU and VDDSHVx [x=0-5] are dual voltage IO supplies which can be operated at 1.8V or 3.3V depending on the application requirements. When any of the VDDSHV_MCU or VDDSHVx [x=0-5] IO supplies are operating at 1.8V, they shall be ramped up with other 1.8V supplies during the 1.8V ramp period defined by this waveform.
6. The VMON_1P8_MCU and VMON_1P8_SOC inputs are used to monitor supply voltage and shall be connected to the respective 1.8V supply source.
7. VDDS_DDR and VDDS_DDR_C are expected to be powered by the same source such that they ramp together.
8. VDD_CORE and VDDR_CORE are expected to be powered by the same source such that they ramp together.
9. VPP is the 1.8V eFuse programming supply, which shall be left floating (HiZ) or grounded during power-up/down sequences and during normal device operation. This supply shall only be sourced while programming eFuse.

7.10.2.3 Power-Down Sequencing

Figure 7-4 describes the device power-down sequencing.

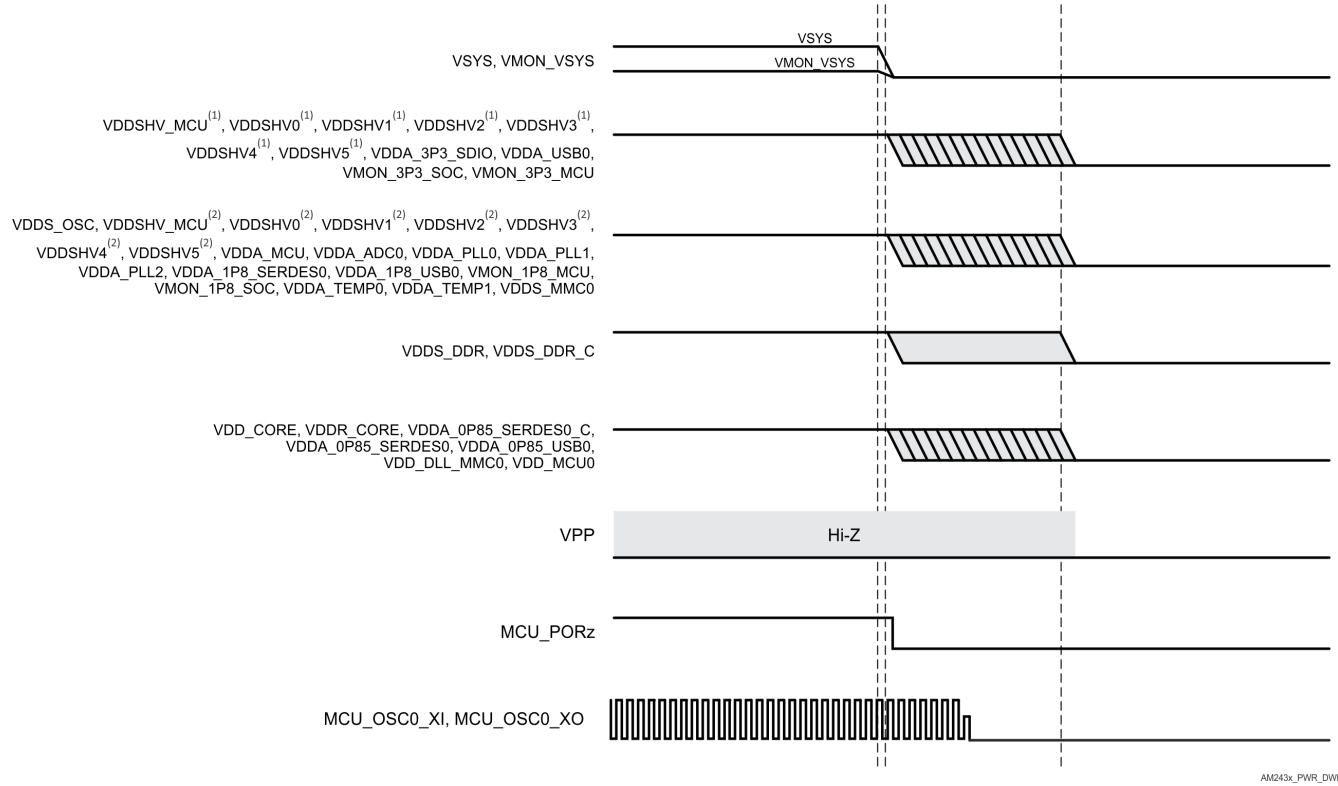

Figure 7-4. Power-Down Sequencing

1. VDDSHV_MCU and VDDSHVx [x=0-5] when operating at 3.3V.
2. VDDSHV_MCU and VDDSHVx [x=0-5] when operating at 1.8V.

7.10.3 System Timing

For more details about features and additional description information on the subsystem multiplexing signals, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

7.10.4 Clock Specifications

7.10.4.1 Input Clocks / Oscillators

Various external clock inputs/outputs are needed to drive the device. Summary of these input clock signals is as follows:

- MCU_OSC0_XI/MCU_OSC0_XO — External main crystal interface pins connected to the internal high-frequency oscillator (MCU_HFOSC0), which is the default clock source for internal reference clock MCU_HFOSC0_CLKOUT.
- General purpose clock inputs
 - MCU_EXT_REFCLK0 — Optional external system clock input for MCU domain.
 - EXT_REFCLK1 — Optional external system clock input for MAIN domain.
 - SERDES0_REFCLK0P/N — Optional SERDES0 reference clock input for PCIe.
- External CPTS reference clock inputs
 - CP_GEMAC_CPTS0_RFT_CLK — CPTS reference clock input.
 - CPTS_RFT_CLK — CPTS reference clock input.

Figure 7-14 shows the external input clock sources and the output clocks to peripherals.

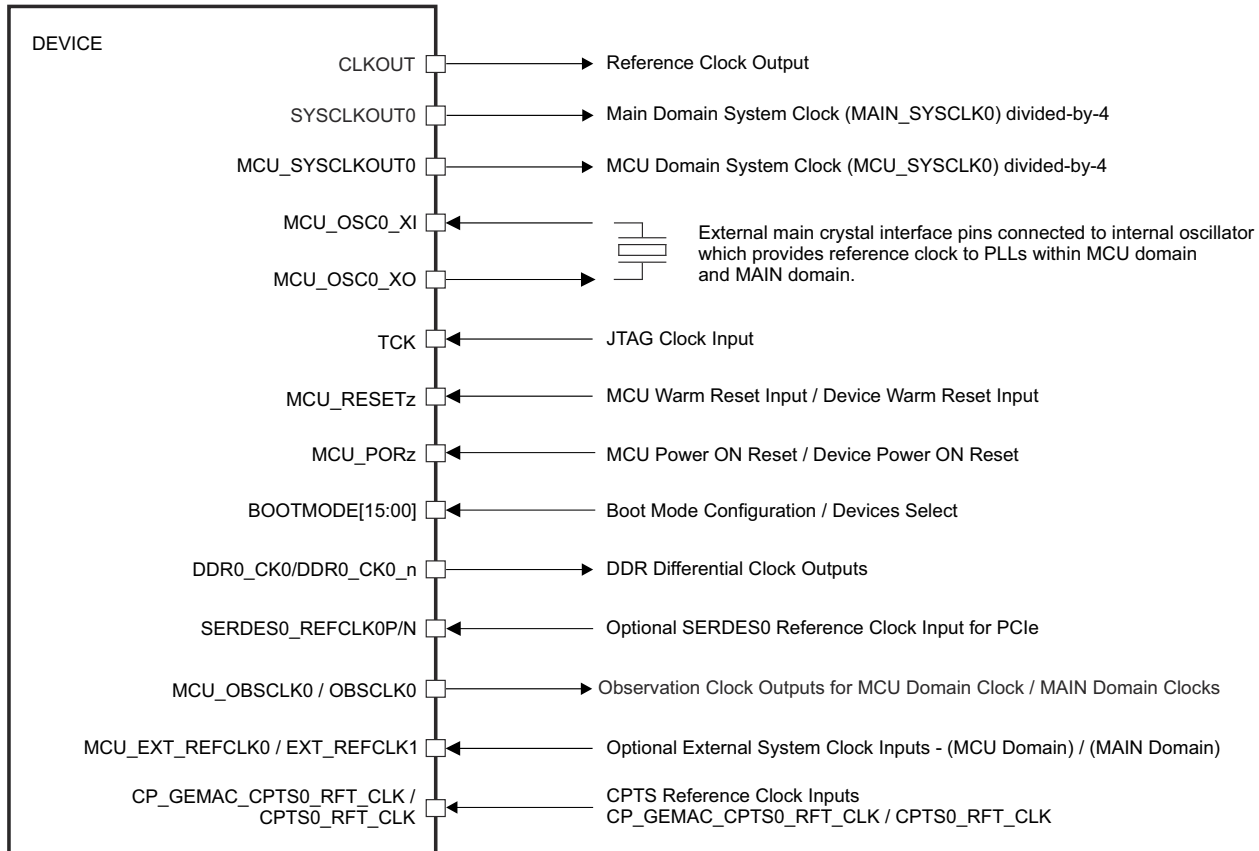

Figure 7-14. Input Clocks Interface

For more information about Input clock interfaces, see *Clocking* section in *Device Configuration* chapter in the device TRM.

7.10.4.1.1 MCU_OSC0 Internal Oscillator Clock Source

Figure 7-15 shows the recommended crystal circuit. All discrete components used to implement the oscillator circuit should be placed as close as possible to the MCU_OSC0_XI and MCU_OSC0_XO pins.

Figure 7-15. MCU_OSC0 Crystal Implementation

The crystal must be in the fundamental mode of operation and parallel resonant. Table 7-18 summarizes the required electrical constraints.

Table 7-18. MCU_OSC0 Crystal Circuit Requirements

PARAMETER		MIN	TYP	MAX	UNIT

C _{shunt}	Crystal Circuit Shunt Capacitance	ESR _{xtal} = 30 Ω	25 MHz		7	pF
		ESR _{xtal} = 40 Ω	25 MHz		5	pF
		ESR _{xtal} = 50 Ω	25 MHz		5	pF
ESR _{xtal}	Crystal Effective Series Resistance				100	Ω

When selecting a crystal, the system design must consider temperature and aging characteristics of the crystal based on worst case environment and expected life expectancy of the system.

Table 7-19 details the switching characteristics of the oscillator.

Table 7-19. MCU_OSC0 Switching Characteristics - Crystal Mode

PARAMETER		MIN	TYP	MAX	UNIT

C _{XIXO}	XI to XO Mutual Capacitance				0.01	pF
t _s	Start-up Time	4			ms	

Figure 7-16. MCU_OSC0 Start-up Time

7.10.4.1.1.1 Load Capacitance

The crystal circuit must be designed such that it applies the appropriate capacitive load to the crystal, as defined by the crystal manufacturer. The capacitive load, C_L, of this circuit is a combination of discrete capacitors C_{L1}, C_{L2}, and several parasitic contributions. PCB signal traces which connect crystal circuit components to MCU_OSC0_XI and MCU_OSC0_XO have parasitic capacitance to ground, C_{PCBXI} and C_{PCBXO}, where the

PCB designer should be able to extract parasitic capacitance for each signal trace. The MCU_OSC0 circuits and device package have combined parasitic capacitance to ground, C_{PCBXI} and C_{PCBXO} , where these parasitic capacitance values are defined in [Table 7-19](#).

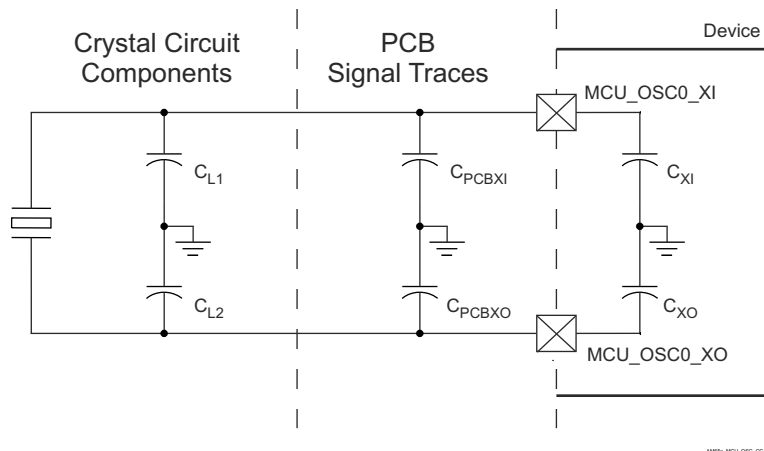

Figure 7-17. Load Capacitance

Load capacitors, C_{L1} and C_{L2} in [Figure 7-15](#), should be chosen such that the below equation is satisfied. C_L in the equation is the load specified by the crystal manufacturer.

$$C_L = [(C_{L1} + C_{PCBXI} + C_{XI}) \times (C_{L2} + C_{PCBXO} + C_{XO})] / [(C_{L1} + C_{PCBXI} + C_{XI}) + (C_{L2} + C_{PCBXO} + C_{XO})]$$

To determine the value of C_{L1} and C_{L2} , multiply the capacitive load value C_L by 2. Using this result, subtract the combined values of $C_{PCBXI} + C_{XI}$ to determine the value of C_{L1} and the combined values of $C_{PCBXO} + C_{XO}$ to determine the value of C_{L2} . For example, if $C_L = 10$ pF, $C_{PCBXI} = 2.9$ pF, $C_{XI} = 0.5$ pF, $C_{PCBXO} = 3.7$ pF, $C_{XO} = 0.5$ pF, the value of $C_{L1} = [(2C_L) - (C_{PCBXI} + C_{XI})] = [(2 \times 10 \text{ pF}) - 2.9 \text{ pF} - 0.5 \text{ pF}] = 16.6$ pF and $C_{L2} = [(2C_L) - (C_{PCBXO} + C_{XO})] = [(2 \times 10 \text{ pF}) - 3.7 \text{ pF} - 0.5 \text{ pF}] = 15.8$ pF

7.10.4.1.1.2 Shunt Capacitance

The crystal circuit must also be designed such that it does not exceed the maximum shunt capacitance for MCU_OSC0 operating conditions defined in [Table 7-18](#). Shunt capacitance, C_{shunt} , of the crystal circuit is a combination of crystal shunt capacitance and parasitic contributions. PCB signal traces which connect crystal circuit components to MCU_OSC0 have mutual parasitic capacitance to each other, $C_{PCBXIXO}$, where the PCB designer should be able to extract mutual parasitic capacitance between these signal traces. The device package also has mutual parasitic capacitance, C_{XIXO} , where this mutual parasitic capacitance value is defined in [Table 7-19](#).

PCB routing should be designed to minimize mutual capacitance between XI and XO signal traces. This is typically done by keeping signal traces short and not routing them in close proximity. Mutual capacitance can also be minimized by placing a ground trace between these signals when the layout requires them to be routed in close proximity. It is important to minimize the mutual capacitance on the PCB to provide as much margin as possible when selecting a crystal.

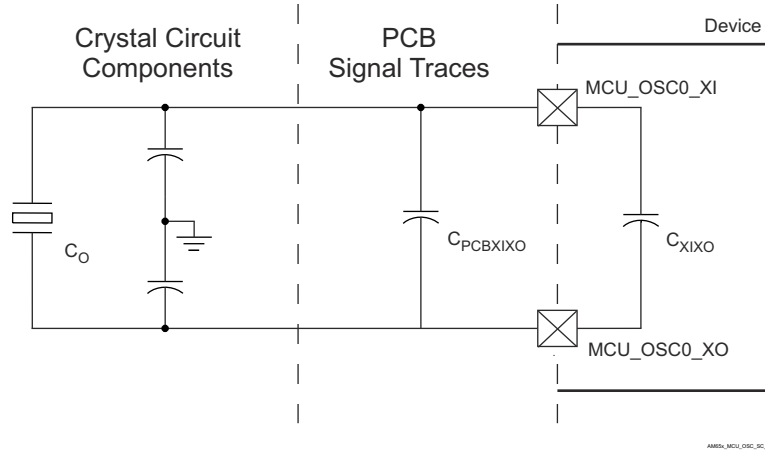

Figure 7-18. Shunt Capacitance

A crystal should be chosen such that the below equation is satisfied. C_O in the equation is the maximum shunt capacitance specified by the crystal manufacturer.

$$C_{shunt} \geq C_O + C_{PCBXIXO} + C_{XIXO}$$

For example, the equation would be satisfied when the crystal being used is 25 MHz with an ESR = 30 Ω , $C_{PCBXIXO} = 0.04$ pF, $C_{XIXO} = 0.01$ pF, and shunt capacitance of the crystal is less than or equal to 6.95 pF.

7.10.4.1.2 MCU_OSC0 LVCMOS Digital Clock Source

Figure 7-19 shows the recommended oscillator connections when MCU_OSC0_XI is connected to a 1.8-V LVCMOS square-wave digital clock source.

Note

A DC steady-state condition is not allowed on MCU_OSC0_XI when the oscillator is powered up. This is not allowed because MCU_OSC0_XI is internally AC coupled to a comparator that may enter a unknown state when DC is applied to the input. Therefore, application software should power down MCU_OSC0 any time MCU_OSC0_XI is not toggling between logic states.

Figure 7-19. 1.8-V LVCMOS-Compatible Clock Input

7.10.4.2 Output Clocks

The device provides several system clock outputs. Summary of these output clocks are as follows:

- **MCU_SYCLKOUT0**
 - MCU_SYCLKOUT0 is the MCU Domain system clock (MCU_SYCLK0) divided-by-4. This clock output is provided for test and debug purposes only.
- **MCU_OBSCLK0**
 - Observation clock output for test and debug purposes only.
- **SYCLKOUT0**
 - SYCLKOUT0 is the Main domain system clock (MAIN_SYCLK0) divided-by-4. This clock output is provided for test and debug purposes only.
- **CLKOUT0**
 - CLKOUT0 is the Ethernet Subsystem clock (MAIN_PLL0_HSDIV4_CLKOUT) divided-by-5 or divided-by-10. This clock output was provided to source to the external PHY. When configured to operate as the RMIIClock source (50 MHz), it must also be routed back to the RMIICLK pin for proper device operation.
- **OBSCLK0**
 - Observation clock output for test and debug purposes only.
- **GPMC_FCLK_MUX**
 - GPMC_FCLK_MUX is the GPMC0 functional clock (GPMC_FCLK). This clock is provided as an alternative GPMC interface clock when attached devices require a continuous running clock.

For more information, see *Clock Outputs* section in *Clocking* chapter and *GPMC Clock Configuration* section in *Peripherals* chapter in the device TRM.

7.10.4.3 PLLs

Power is supplied to the Phase-Locked Loop circuits (PLLs) by internal regulators that derive their power from off-chip power-sources.

There is one PLL in the MCU domain:

- MCU0_PLL

There are six PLLs in the MAIN domain:

- ARM0_PLL
- MAIN_PLL
- PER0_PLL
- PER1_PLL
- DDR PLL
- R5F PLL

Note

For more information, see:

- *Device Configuration / Clocking / PLLs* section in the device TRM.
 - *Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem - Gigabit (PRU_ICSSG)* section in the device TRM.
-

Note

The input reference clock (MCU_OSC0_XI / MCU_OSC0_XO) is specified and the lock time is ensured by the PLL controller, as documented in the *Device Configuration* chapter in the device TRM.

- A. RGMII[x]_RXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGMII[x]_RD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_RXC and data bits 7-4 on the falling edge of RGMII[x]_RXC. Similarly, RGMII[x]_RX_CTL carries RXDV on rising edge of RGMII[x]_RXC and RXERR on falling edge of RGMII[x]_RXC.

- A. TXC is delayed internally before being driven to the RGMII[x]_TXC pin. This internal delay is always enabled.
- B. Data and control information is received using both edges of the clocks. RGMII[x]_TD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_TXC and data bits 7-4 on the falling edge of RGMII[x]_TXC. Similarly, RGMII[x]_TX_CTL carries TXEN on rising edge of RGMII[x]_TXC and TXERR on falling edge of RGMII[x]_TXC.

- (1) The FA5 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.
- (2) The FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.
- (3) P = PageBurstAccessTime × (TimeParaGranularity + 1) × GPMC_FCLK⁽⁵⁾
- (4) H = AccessTime × (TimeParaGranularity + 1) × GPMC_FCLK⁽⁵⁾
- (5) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

- The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su}(SDA-SCLH) \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the low period of the SCL signal. If such a device does stretch the low period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{su}(SDA-SCLH) = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C-Bus Specification) before the SCL line is released.
- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- The maximum $t_h(SDA-SCLL)$ has only to be met if the device does not stretch the low period [$t_w(SCLL)$] of the SCL signal.
- C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed
- Software must properly configure the I2C module registers to achieve the timings shown in this table. See the device TRM for details.
- These timings apply only to I2C0 and MCU_I2C0. I2C[3:1] and MCU_I2C1 use standard LVCMOS buffers to emulate open-drain buffers and their rise/fall times should be referenced in the device IBIS model.

			400 pF Max		400	pF

- (1) For bus line loads C_b between 100 pF and 400 pF the timing parameters must be linearly interpolated.
 (2) A device must internally provide a Data hold time to bridge the undefined part between V_{IH} and V_{IL} of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

7.10.5.12 MMCSD

The MMCSD Host Controller provides an interface to embedded Multi-Media Card (MMC), Secure Digital (SD), and Secure Digital IO (SDIO) devices. The MMCSD Host Controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness.

For more details about MMCSD interfaces, see the corresponding MMC0 and MMC1 subsections within *Signal Descriptions* and *Detailed Description* sections.

Note

Some operating modes require software configuration of the MMC DLL delay settings, as shown in [Table 7-64](#) and [Table 7-73](#).

For more information, see *Multi-Media Card/Secure Digital (MMCSD) Interface* section in *Peripherals* chapter in the device TRM.

7.10.5.12.1 MMC0 - eMMC Interface

MMC0 interface is compliant with the JEDEC eMMC electrical standard v5.1 (JESD84-B51) and it supports the following eMMC applications:

- Legacy speed
- High speed SDR
- High speed DDR
- HS200

Table 7-64 presents the required DLL software configuration settings for MMC0 timing modes.

- (1) i in [i:0] = 7 for OSPI0
- (2) This Hold time requirement is larger than the Hold time provided by a typical flash device. Therefore, the trace length between the SoC and flash device must be sufficiently long enough to ensure that the Hold time is met at the SoC. The length of the SoC's external loopback clock (OSPI_LBCLKO to OSPI_DQS) may need to be shortened to compensate.

7.10.5.15 PCIe

The PCI-Express Subsystem is compliant with the PCIe® Base Specification, Revision 4.0. Refer to the specification for timing details.

For more details about features and additional description information on the device Peripheral Component Interconnect Express, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

For more information, see *Peripheral Component Interconnect Express (PCIe) Subsystem* section in *Peripherals* chapter in the device TRM.

7.10.5.16 PRU_ICSSG

The device has integrated two identical Programmable Real-Time Unit Subsystem and Industrial Communication Subsystems - Gigabit (PRU_ICSSG), PRU_ICSSG0 and PRU_ICSSG1. The programmable nature of the PRU cores, along with their access to pins, events and all device resources, provides flexibility in implementing fast real-time responses, specialized data handling operations, custom peripheral interfaces, and in offloading tasks from the other processor cores in the device.

For more details about features and additional description information on the device PRU_ICSSG, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

Note

The PRU_ICSSG0 and PRU_ICSSG1 support an internal wrapper multiplexing that expands the device top-level multiplexing.

7.10.5.16.1 PRU_ICSSG Programmable Real-Time Unit (PRU)

Note

The PRU_ICSSG PRU signals have different functionality depending on the mode of operation. The signal naming in this section matches the naming used in the *PRU Module Interface* section in the device TRM.

Note

In order to ensure the MII_G_RT I/O timing values published in the device data sheet, the PRU_ICSSG ICSSGn_CORE_CLK (where n = 0 to 1) core clock must be configured for 200 MHz, 225 MHz, or 250 MHz and the TX_CLK_DELAYn (where n = 0 or 1) bit field in the ICSSG_TXCFG0/1 register must be set to 0h (default value).

Table 7-121, Table 7-122, Figure 7-101, Table 7-123, Figure 7-102, Table 7-124, Figure 7-103, Table 7-125, and Figure 7-104 present timing conditions, requirements, and switching characteristics for PRU_ICSSG MII.

- A. RGMII[x]_RXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGMII[x]_RD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_RXC and data bits 7-4 on the falling edge of RGMII[x]_RXC. Similarly, RGMII[x]_RX_CTL carries RXDV on rising edge of RGMII[x]_RXC and RXERR on falling edge of RGMII[x]_RXC.

- A. TXC is delayed internally before being driven to the RGMII[x]_TXC pin. This internal delay is always enabled.
- B. Data and control information is received using both edges of the clocks. RGMII[x]_TD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_TXC and data bits 7-4 on the falling edge of RGMII[x]_TXC. Similarly, RGMII[x]_TX_CTL carries TXEN on rising edge of RGMII[x]_TXC and TXERR on falling edge of RGMII[x]_TXC.

8 Detailed Description

8.1 Overview

AM243x is an extension of the Sitara's industrial-grade family of heterogeneous Arm processors. AM243x is built for industrial applications, such as motor drives and programmable logic controllers (PLCs), which require a unique combination of real-time processing and communications with applications processing. AM243x combines two instances of Sitara's gigabit TSN-enabled PRU-ICSSG, up to four Cortex-R5F MCUs and a Cortex-M4F MCU.

AM243x is architected to provide real-time performance through the high-performance R5Fs, Tightly-Coupled Memory banks, configurable SRAM partitioning, and low-latency paths to and from peripherals for rapid data movement in and out of the SoC. This deterministic architecture allows for AM243x to handle the tight control loops found in servo drives, while the peripherals like FSI, GPMC, PWMs, sigma delta decimation filters, and absolute encoder interfaces help enable a number of different architectures found in these systems.

The PRU-ICSSG in AM243x provides the flexible industrial communications capability necessary to run gigabit TSN, EtherCAT, PROFINET, EtherNet/IP, and various other protocols. In addition, the PRU-ICSSG also enables additional interfaces in the SoC including sigma delta decimation filters and absolute encoder interfaces.

Functional safety features can be enabled through the integrated Cortex-M4F along with its dedicated peripherals which can all be isolated from the rest of the SoC. AM243x also supports secure boot.

Note

For more information on features, subsystems, and architecture of superset device System on Chip (SoC), see the device TRM.

8.2 Processor Subsystems

8.2.1 Arm Cortex-R5F Subsystem (R5FSS)

The R5FSSSS is a dual-core implementation of the Arm® Cortex®-R5F processor configured for dual/single-core operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various wrappers for protocol conversion and address translation for easy integration into the SoC.

Note

The Cortex®-R5F processor is a Cortex-R5 processor that includes the optional Floating Point Unit (FPU) extension.

For more information, see *Dual-R5F Subsystem (R5FSS)* section in *Processors and Accelerators* chapter in the device TRM.

8.2.2 Arm Cortex-M4F (M4FSS)

The M4FSS module on the AM243x device provides a safety channel (secondary channel - working in conjunction with an external microcontroller)- or- a general purpose MCU.

The M4FSS module supports the following features:

- Cortex M4F With MPU
- ARMv7-M architecture
- Support for Nested Vectored Interrupt Controller (NVIC) with 64 inputs
- Ability to executed code from internal or external memories
- 192 KB of SRAM (I-Code)
- 64 KB of SRAM (D-Code)
- External access to internal memories if allowed
- Debug Support Including:
 - DAP based Debug to the CPU Core
 - Full Debug Features of CPU Core are enabled
 - Standard ITM trace
 - CTM Cross Trigger
 - ETM Trace Support
- Fault Detection and Correction
 - SECEDED ECC protection on I-CODE
 - SECEDED ECC protection on D-CODE
 - Fault Error Interrupt Output

For more information, see *Arm Cortex M4F Subsystem (M4FSS)* section in *Processors and Accelerators* chapter in the device TRM.

8.3 Accelerators and Coprocessors

8.3.1 Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU_ICSSG)

The PRU_ICSSG module supports the following main features:

- 3x PRUs
 - General-Purpose PRU (PRU)
 - Real-Time PRU(RTU_PRU)
 - Transmit PRU (TX_PRU)
- 2x Ethernet MII_G_RT configurable connection to PRUs
 - Up to 2x RGMII ports
 - Up to 2x MII ports
 - RX Classifier
- 2x Industrial Ethernet Peripheral (IEP) to manage and generate industrial Ethernet functions
- 2x Industrial Ethernet 64-bit timers, each with 10 capture and 16 compare events, along with slow and fast compensation.
- 1x MDIO
- 1x UART, with a dedicated 192-MHz clock input
- Supports up to 4 sets of 3-phased motor control, with 12 primary and 12 complimentary programmable PWM outputs.
- Supports up to 9 safety events with optional external trip I/O per PWM set with hardware glitch filter.
- 1x Enhanced Capture Module (ECAP)
- 1x Interrupt Controller (INTC)
 - 160 input events supported – 96 external, 64 internal
- Flexible power management support
- Integrated switched central resource with programmable priority
- All memories support ECC

For more information, see *Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem - Gigabit (PRU_ICSSG)* section in *Processors and Accelerators* chapter in the device TRM.

8.4 Other Subsystems

8.4.1 PDMA Controller

The Peripheral DMA is a simple DMA which has been architected to specifically meet the data transfer needs of peripherals, which perform data transfers using memory mapped registers accessed via a standard non-coherent bus fabric. The PDMA module is intended to be located close to one or more peripherals which require an external DMA for data movement and is architected to reduce cost by using VBUSP interfaces and supporting only statically configured Transfer Request (TR) operations.

The PDMA is only responsible for performing the data movement transactions which interact with the peripherals themselves. Data which is read from a given peripheral is packed by a PDMA source channel into a PSI-L data stream which is then sent to a remote peer UDMA-P destination channel which then performs the movement of the data into memory. Likewise, a remote UDMA-P source channel fetches data from memory and transfers it to a peer PDMA destination channel over PSI-L which then performs the writes to the peripheral.

The PDMA architecture is intentionally heterogeneous (UDMA-P + PDMA) to right size the data transfer complexity at each point in the system to match the requirements of whatever is being transferred to or from. Peripherals are typically FIFO based and do not require multi-dimensional transfers beyond their FIFO dimensioning requirements, so the PDMA transfer engines are kept simple with only a few dimensions (typically for sample size and FIFO depth), hardcoded address maps, and simple triggering capabilities.

Multiple source and destination channels are provided within the PDMA which allow multiple simultaneous transfer operations to be ongoing. The DMA controller maintains state information for each of the channels and employs round-robin scheduling between channels in order to share the underlying DMA hardware.

There are five PDMA modules in the device.

For more information, see *PDMA Controller* section in *DMA Controllers* chapter in the device TRM.

8.4.2 Peripherals

8.4.2.1 ADC

The analog-to-digital converter (ADC) module is an eight-channel general purpose analog-to-digital converter, which supports 12-bit conversion samples from an analog front end (AFE).

There is one ADC module in the device.

For more information, see *Analog-to-Digital Converter (ADC)* section in *Peripherals* chapter in the device TRM.

8.4.2.2 DCC

The Dual Clock Comparator (DCC) is used to determine the accuracy of a clock signal during the time execution of an application. Specifically, the DCC is designed to detect drifts from the expected clock frequency. The desired accuracy can be programmed based on calculation for each application. The DCC measures the frequency of a selectable clock source using another input clock as a reference.

The device has seven instances of DCC modules.

For more information, see *Dual Clock Comparator (DCC)* section in *Peripherals* chapter in the device TRM.

8.4.2.3 Dual Data Rate (DDR) External Memory Interface (DDRSS)

Integrated in MAIN domain: one instance of DDR Subsystem (DDRSS) is used as an interface to external RAM devices which can be utilized for storing program or data. DDRSS provides the following main features:

- Support of DDR4 / LPDDR4 memory types
- 16-bit memory bus interface with in-line ECC
- Up to 2 GB memory address range
- System bus interface: little endian only with 128-bit data width
- Configuration bus Interface: little endian only with 32-bit data width
- Support of dual rank configuration
- Support of automatic idle power saving mode when no or low activity is detected
- Class of Service (CoS) - three latency classes supported
- Prioritized refresh scheduling
- Statistical counters for performance management

For more information, see *DDR Subsystem (DDRSS)* section in *Peripherals* chapter in the device TRM.

8.4.2.4 ECAP

This section describes the Enhanced Capture (ECAP) module for the device.

For more information, see *Enhanced Capture (ECAP) Module* section in *Peripherals* chapter in the device TRM.

8.4.2.5 EPWM

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The EPWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the EPWM is built up from smaller single channel modules with separate resources and that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In the further description the letter x within a signal or module name is used to indicate a generic EPWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the EPWM_x instance. Thus, EPWM1A and EPWM1B belong to EPWM1, EPWM2A and EPWM2B belong to EPWM2, and so forth.

Additionally, the EPWM integration allows this synchronization scheme to be extended to the capture peripheral modules (ECAP). The number of modules is device-dependent and based on target application needs. Modules can also operate stand-alone.

The device has six instances of EPWM modules.

For more information, see *Enhanced Pulse Width Modulation (EPWM) Module* section in *Peripherals* chapter in the device TRM.

8.4.2.6 ELM

The Error Location Module (ELM) is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. A host processor can then correct the data block by flipping the bits to which the ELM error-location outputs point.

When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller. ELM can be also used to support parallel NOR flash or NAND flash.

The General-Purpose Memory Controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The ELM extracts error addresses from these syndrome polynomials.

For more information, see *Error Location Module (ELM)* section in *Peripherals* chapter in the device TRM.

8.4.2.7 ESM

The Error Signaling Module (ESM) aggregates safety-related events and/or errors from throughout the device into one location. It can signal both low and high priority interrupts to a processor to deal with a safety event and/or manipulate an I/O error pin to signal an external hardware that an error has occurred. Therefore an external controller is able to reset the device or keep the system in safe, known state.

For more information, see *Error Signaling Module (ESM)* section in *Peripherals* chapter in the device TRM.

8.4.2.8 GPIO

The general-purpose input/output (GPIO) peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs. When configured as an output, user can write to an internal register to control the state driven on the output pin. When configured as an input, user can obtain the state of the input by reading the state of an internal register.

In addition, the GPIO peripheral can produce host CPU interrupts and DMA synchronization events in different interrupt/event generation modes.

For more information, see *General-Purpose Interface (GPIO)* section in *Peripherals* chapter in the device TRM.

8.4.2.9 EQEP

The Enhanced Quadrature Encoder Pulse (EQEP) peripheral is used for direct interface with a linear or rotary incremental encoder to get position, direction and speed information from a rotating machine for use in high performance motion and position control system. The disk of an incremental encoder is patterned with a single track of slots patterns. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position and zero reference.

To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is realized with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90 degrees out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel and vice versa.

The encoder wheel typically makes one revolution for every revolution of the motor or the wheel may be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder directly coupled to a motor running at 5000 revolutions per minute (rpm) results in a frequency of 166.6 KHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

For more information, see *Enhanced Quadrature Encoder Pulse (EQEP) Module* section in *Peripherals* chapter in the device TRM.

8.4.2.10 GPMC

The GPMC module supports the following features:

- Data path to external memory device can be 32, 16 or 8 bits wide
- Support for the following memory types:
 - Asynchronous or synchronous 8-bit memory or device (non-burst device)
 - Asynchronous or synchronous 16-bit memory or device
 - Asynchronous or synchronous 32-bit memory or device
 - 16-bit non-multiplexed NOR Flash device
 - 16-bit address and 32-bit address and data multiplexed NOR Flash device
 - 8-bit and 16-bit NAND flash device
 - 16-bit and 32bit pSRAM device
- Supports Error Code detection using BCH code (t=4, 8 or 16) or Hamming code for 8-bit or 16-bit NAND-flash, organized with page size of 512 Byte, 1Kbytes, or more. • Supports 1 GByte maximum addressing capability, which can be divided into 8 independent chip-select with programmable bank size and base address on 16 MByte, 32 MByte, 64 MByte, or 128 MByte boundary.
- Fully-pipelined operation for optimal memory bandwidth usage
- Supports external device clock frequency of /1, /2, /3, and /4 divide of interface clock
- Supports programmable auto-clock gating when there is no access
- Supports Mdlereq/SidleAck protocol
- Supports the following interface protocols when communicating with external memory or external devices:
 - Asynchronous read/write access
 - Asynchronous read page access (4-8-16 Word16), 4-8-16 Word32
 - Synchronous read/write access
 - Synchronous read burst access without wrap capability (4-8-16-32 Word16, 4-8-16 Word32)
 - Synchronous read burst access with wrap capability (4-8-16-32 Word16, 4-8-16 Word32)
- Address and data multiplexed access
- Each chip-select has independent and programmable control signal timing parameters for Setup and Hold time. Parameters are set according to the memory device timing parameters, with one interface clock cycle timing granularity.
- Flexible internal access time control (wait state) and flexible handshake mode using external WAIT pin
- Supports bus keeping
- Supports bus turn around
- Pre-fetch and write posting engine associated with system DMA, to get full performance from NAND device, and with minimum impact on NOR/SRAM concurrent access monitoring (up to 4 WAIT pins)

For more information, see *General-Purpose Memory Controller (GPMC)* section in *Peripherals* chapter in the device TRM.

8.4.2.11 I2C

The Inter-IC Bus (I2C) interface is implemented using the mshsi2c module. This peripheral implements the multi-master I2C bus, which allows serial transfer of 8-bit data to and from other I2C master and slave devices, through a two-wire interface.

The I2C module supports the following main features:

- Compliant with Philips I2C specification version 2.1

- Supports standard mode (up to 100K bits/s), fast mode (up to 400K bits/s), and high-speed mode (up to 3.4Mb/s).
- Multi-master transmitter and slave receiver mode
- Multi-master receiver and slave transmitter mode
- Combined master transmit/receive and receive/transmit modes
- 7-bit and 10-bit device addressing modes
- Built-in FIFO for buffered read or write
 - Parameterizable size of 8 to 64 bytes
- Programmable multi-slave channel (responds to 4 separate addresses)
- Programmable clock generation
- Support for asynchronous wake-up
- One interrupt line

For more information, see *Inter-Integrated Circuit (I2C) Interface* section in *Peripherals* chapter in the device TRM.

8.4.2.12 MCAN

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time control with a high level of security. CAN has high immunity to electrical interference and the ability to self-diagnose and repair data errors. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The MCAN module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The device supports 2 MCAN modules

For more information, see *Modular Controller Area Network (MCAN)* section in *Peripherals* chapter in the device TRM.

8.4.2.13 MCRC Controller

VBUSM CRC controller is a module which is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of a memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into MCRC Controller. The responsibility of MCRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. MCRC controller provides four channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system. Channel 1 can also be put into data trace mode, where MCRC controller compresses each data being read through CPU read data bus.

For more information, see *MCRC Controller* section in *Interprocessor Communication* chapter in the device TRM.

8.4.2.14 MCSPI

The MCSPI module is a multichannel transmit/receive, master/slave synchronous serial bus.

There are total of seven MCSPI modules in the device.

For more information, see *Multichannel Serial Peripheral Interface (MCSPI)* section in *Peripherals* chapter in the device TRM.

8.4.2.15 MMCSDB

There are two Multi-Media Card/Secure Digital (MMCSDB) modules inside the device - MMCSDB0 and MMCSDB1. Each MMCSDB module includes one MMCSDB Host Controller, where MMCSDB0 is associated with MMC0 and MMCSDB1 is associated with MMC1.

The MMCSDB Host Controller supports:

- One controller with 8-bit wide data bus
- One controller with 4-bit wide data bus

- Support of eMMC5.1 Host Specification (JESD84-B51)
- Support of SD Host Controller Standard Specification - SDIO 3.00
- Integrated DMA controller supporting SD Advanced DMA - ADMA2 and ADMA3
- eMMC Electrical Standard 5.1 (JESD84-B51)
- Multi-Media card features:
 - Backward compatible with earlier eMMC standards
 - Legacy MMC SDR: 1.8 V, 8/4/1-bit bus width, 0-25 MHz, 25/12.5/3.125 MB/s
 - High Speed SDR: 1.8 V, 8/4/1-bit bus width, 0-50 MHz, 50/25/6.25 MB/s
 - High Speed DDR: 1.8 V, 8/4-bit bus width, 0-50 MHz, 100/50 MB/s
 - HS200 SDR: 1.8 V, 0-200 MHz, 8/4-bit bus width, 200/100 MB/s
- SD card support: SDIO, SDR12, SDR25, SDR50, DDR50
- System bus interface: CBA 4.0 VBUSM master port with 64-bit data width and 64-bit address, little endian only
- Configuration bus interface: CBA 4.0 VBUSM with 32-bit data width, 32-bit aligned accesses only, linear incrementing addressing mode, little endian only

For more information, see *Multi-Media Card/Secure Digital (MMCSD) Interface* section in *Peripherals* chapter in the device TRM.

8.4.2.16 OSPI

The Octal Serial Peripheral Interface (OSPI) module is a kind of Serial Peripheral Interface (SPI) module which allows single, dual, quad or octal read and write access to external flash devices. This module has a memory mapped register interface, which provides a direct memory interface for accessing data from external flash devices, simplifying software requirements.

The OSPI module is used to transfer data, either in a memory mapped direct mode (for example a processor wishing to execute code directly from external flash memory), or in an indirect mode where the module is set-up to silently perform some requested operation, signalling its completion via interrupts or status registers. For indirect operations, data is transferred between system memory and external flash memory via an internal SRAM which is loaded for writes and unloaded for reads by a device master at low latency system speeds. Interrupts or status registers are used to identify the specific times at which this SRAM should be accessed using user programmable configuration registers.

For more information, see *Octal Serial Peripheral Interface (OSPI)* section in *Peripherals* chapter in the device TRM.

8.4.2.17 Peripheral Component Interconnect Express (PCIe)

The PCIe subsystem supports the following main features:

- Dual mode – root port (RP) or end point (EP) modes. Selectable through bootstrap pins.
- 1-lane configuration with up to 5.0GT/lane.
- 62.5/125 MHz operation on PIPE interface for Gen1/Gen2 respectively
- Constant 32-bit PIPE width for Gen1/Gen2 modes
- Maximum outbound payload size of 128 bytes
- Maximum inbound payload size of 128 bytes
- Maximum remote read request size of 4K bytes
- Maximum number of nonposted outstanding transactions: 8 on each VBUSM interface.
- Four virtual channels (4VC)
- Resizable BAR capability
- SRIS support
- Power Management
 - L1 Power Management Substate support
 - D1 support
 - L1 Power Shutoff support
- Legacy, MSI, and MSI-X interrupt support
- 32 outbound address translation regions
- Precision time measurement (PTM)

For more information, see *Peripheral Component Interconnect Express (PCIe) Subsystem* section in *Peripherals* chapter in the device TRM.

8.4.2.18 Serializer/Deserializer (SerDes)

Integrated in the MAIN domain is one instance of high-speed differential interface implemented with Serializer/Deserializer (SERDES) Multi-protocol Multi-link modules with the following main blocks:

- Single-lane PHY with common module for peripheral and Tx clocking handling
- Physical coding sub-block for data translation from/to the parallel interface, as well as data encoding/decoding and symbol alignment
- MUX module for device interface multiplexing into a single SERDES lane (Tx and Rx)
- A wrapper for sending control and reporting status signals from the SerDes and muxes

For more information, see *Serializer/Deserializer (SerDes)* section in *Peripherals* chapter in the device TRM.

8.4.2.19 RTI

This section describes the Real Time Interrupt (RTI) modules with Windowed Watchdog Timer (WWDT) functionality for the device.

For more information, see *Real Time Interrupt (RTI) Module* section in *Peripherals* chapter in the device TRM.

8.4.2.20 DMTIMER

The DMTIMER module supports the following main features:

- Interrupts generated on overflow, compare and capture
- Free running 32-bit upward counter
- Supported modes:
 - Compare and capture modes
 - Auto-reload mode
 - Start-stop mode
- Programmable divider clock source (2ⁿ with n=[0:8])
- Dedicated input trigger for capture mode, and dedicated output trigger/PWM (pulse width modulation) signal
- On the fly read/write register (while counting)
- Generate 1-ms tick with 32768-Hz functional clock

For more information, see *Timers* section in *Peripherals* chapter in the device TRM.

8.4.2.21 UART

The UART module supports the following main features:

- 16C750 compatibility
- Baud rate from 300 bps up to 3.6864 Mbps (subject to functional clock frequency)
- Auto-baud between 1200 bps and 115.2 Kbps
- Software/hardware flow control
 - Programmable Xon/Xoff characters
 - Programmable Auto-RTS and Auto CTS
- Programmable serial interface characteristics
 - 5, 6, 7, or 8-bit characters
 - Even, odd, mark (always 1), space (always 0), or no parity (non-parity bit frame) bit generation and detection
 - 1-, 1.5-, or 2-stop bit generation
- Optional multi-drop transmission
- Configurable time-guard feature
- False start bit detection
- Line break generation and detection
- Modem control functions on UART0 (CTS, RTS, DSR, DTR, RI, and DCD)
- Fully prioritized interrupt system controls
- Internal test and loopback capabilities
- RS-485 External transceiver auto flow control support

For more information, see *Universal Synchronous/Asynchronous Receiver/Transmitter (UART)* section in *Peripherals* chapter in the device TRM.

8.4.2.22 Universal Serial Bus Subsystem(USBSS)

The Universal Serial Bus Subsystem (USBSS) module supports the following main features:

USB interface:

- Compliant with USB 3.1 Gen1 specification
- Compliant with xHCI 1.1 specification
- Limited USB 2.0 on-the-go support
- SuperSpeed Gen1 (5 Gbps), high speed (480 Mbps), and full (12Mbps) Device
- SuperSpeed Gen1 (5 Gbps), high speed (480 Mbps), full (12Mbps), and low speed (1.5 Mbps) Host
- Shared USB3.1/USB2.0 port

Dual mode operation:

- OTG 2.0 host negotiation protocol (HNP) support
- OTG 2.0 session request support (SRP) support

Host mode:

- 64 slots supported
- Up to 96 periodic endpoints supported simultaneously
- 256 primary streams supported
- MSI support
- Root hub functionality

For more information, see *Universal Serial Bus (USB) Subsystem* section in *Peripherals* chapter in the device TRM.

9 Applications, Implementation, and Layout

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.2.4 Unused Pins

For more information about Unused Pins, see the *Connections for Unused Pins* section.

9.3 Peripheral- and Interface-Specific Design Information

9.3.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVCMOS interfaces.

- Line spacing:
 - For a line width equal to W , the spacing between two lines must be $2W$, at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the device package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (see [Figure 9-1](#)).

Figure 9-1. Ground Guard Illustration

- Length matching (unless otherwise specified):
 - For bus or traces at frequencies less than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
 - For bus or traces at frequencies greater than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.
- Characteristic impedance
 - Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between 35- Ω and 65- Ω .
- Multiple peripheral support
 - For interfaces where multiple peripherals have to be supported in the star topology, the length of each branch has to be balanced. Before closing the PCB design, it is highly recommended to verify signal integrity based on simulations including actual PCB extraction.

9.3.2 DDR Board Design and Layout Guidelines

The goal of the [AM64x DDR Board Design and Layout Guidelines](#) is to make the DDR system implementation straightforward for all designers. Requirements have been distilled down to a set of layout and routing rules that allow designers to successfully implement a robust design for the topologies that TI supports. TI only supports board designs using DDR4 or LPDDR4 memories that follow the guidelines in this document.

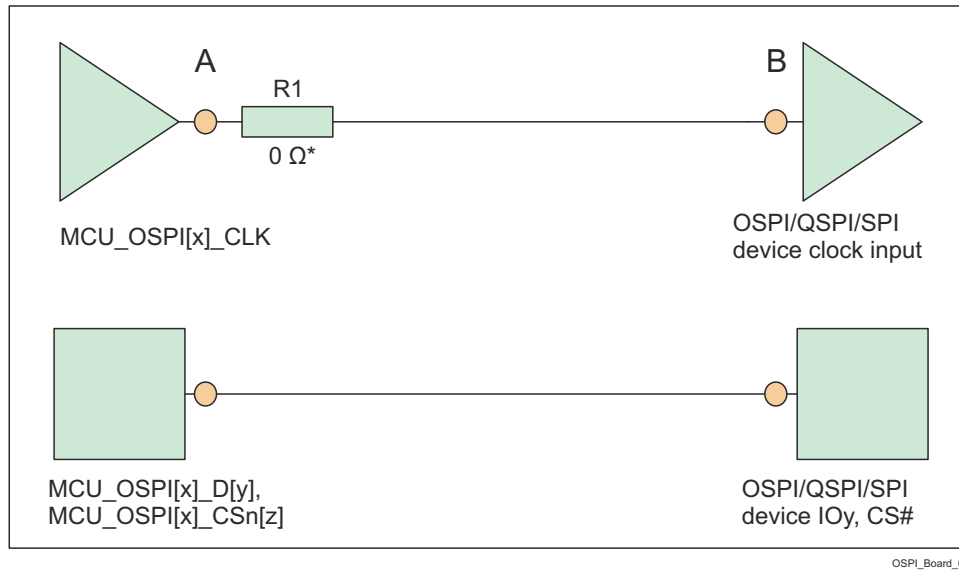

9.3.3 OSPI and QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the OSPI and QSPI interfaces.

9.3.3.1 No Loopback and Internal Pad Loopback

- The MCU_OSPI[x]_CLK output signal must be connected to the CLK pin of the flash device
- The signal propagation delay from the MCU_OSPI[x]_CLK signal to the flash device must be < 450 ps (~7cm as stripline or ~8cm as microstrip)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [OSPI Interface High Level Schematic](#)
- Propagation delays and matching:
 - A to B < 450 ps

- Matching skew: < 60 ps

* 0 Ω resistor (R1), located as close as possible to the MCU_OSPI[x]_CLK pin, is placeholder for fine tuning, if needed.

Figure 9-2. OSPI Interface High Level Schematic

9.3.3.2 External Board Loopback

- The MCU_OSPI[x]_CLK output signal must be connected to the CLK pin of the flash device
- The MCU_OSPI[x]_LBCLKO output signal must be looped back into the MCU_OSPI[x]_DQS input
- The signal propagation delay from the MCU_OSPI[x]_CLK pin to the flash device CLK input pin (A to B) should be approximately equal to half of the signal propagation delay from the MCU_OSPI[x]_LBCLKO pin to the MCU_OSPI[x]_DQS pin ((C to D)/2). See the note below.
- The signal propagation delay from the MCU_OSPI[x]_CLK pin to the flash device CLK input pin (A to B) must be approximately equal to the signal propagation delay of the control and data signals between the flash device and the SoC device (E to F, or F to E)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [OSPI Interface High Level Schematic](#)
- Propagation delays and matching:
 - A to B = E to F = (C to D) / 2
 - Matching skew: < 60 ps

Note

The OSPI Board Loopback Hold time requirement (described in [Section 7.10.5.14, OSPI](#)) is larger than the Hold time provided by a typical flash device. Therefore, the length of MCU_OSPI[x]_LBCLKO pin to the MCU_OSPI[x]_DQS pin (C to D) can be shortened to compensate.

* 0 Ω resistor (R1), located as close as possible to the MCU_OSPI[x]_CLK and MCU_OSPI[x]_LBCLKO pins, is a placeholder for fine tuning, if needed.

Figure 9-3. OSPI Interface High Level Schematic

9.3.3.3 DQS (only available in Octal Flash devices)

- The MCU_OSPI[x]_CLK output signal must be connected to the CLK pin of the flash device
- The DQS pin of the flash devices must be connected to MCU_OSPI[x]_DQS signal
- The signal propagation delay from the MCU_OSPI[x]_CLK pin to the flash device CLK input pin (A to B) should be approximately equal to the signal propagation delay from the MCU_OSPI[x]_DQS pin to the DQS output pin (C to D)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [OSPI Interface High Level Schematic](#)
- Propagation delays and matching:
 - A to B = C to D
 - Matching skew: < 60 ps

ADVANCE INFORMATION

* 0 Ω resistor (R1), located as close as possible to the `MCU_OSPI[x]_CLK` pin, is a placeholder for fine tuning, if needed.

Figure 9-4. OSPI Interface High Level Schematic

9.3.4 USB VBUS Design Guidelines

The USB 3.1 specification allows the VBUS voltage to be as high as 5.5 V for normal operation, and as high as 20 V when the Power Delivery addendum is supported. Some automotive applications require a max voltage to be 30 V.

The device requires the VBUS signal voltage be scaled down using an external resistor divider (as shown in the [Figure 9-5](#)), which limits the voltage applied to the actual device pin (`USB0_VBUS`). The tolerance of these external resistors should be equal to or less than 1%, and the leakage current of zener diode at 5 V should be less than 100 nA.

J7ES_USB_VBUS_01

A. USBn_VBUS, where n = 0.

Figure 9-5. USB VBUS Detect Voltage Divider / Clamp Circuit

The USB0_VBUS pin can be considered to be fail-safe because the external circuit in [Figure 9-5](#) limits the input current to the actual device pin in a case where VBUS is applied while the device is powered off.

9.3.5 System Power Supply Monitor Design Guidelines

The VMON_VSYS pin provides a way to monitor a system power supply. This system power supply is typically a single pre-regulated power source for the entire system. This supply is monitored by comparing the output of an external voltage divider circuit sourced by this supply with an internal voltage reference, with a power fail event being triggered when the voltage applied to VMON_VSYS drops below the internal reference voltage. The actual system power supply voltage trip point is determined by the system designer when selecting component values used to implement the external resistor voltage divider circuit.

When designing the resistor divider circuit it is important to understand various factors which contribute to variability in the system power supply monitor trip point. The first thing to consider is the initial accuracy of the VMON_VSYS input threshold which has a nominal value of 0.45 V, with a variation of $\pm 3\%$. Precision 1% resistors with similar thermal coefficient are recommended for implementing the resistor voltage divider. This minimizes variability contributed by resistor value tolerances. Input leakage current associated with VMON_VSYS must also be considered since any current flowing into the pin creates a loading error on the voltage divider output. The VMON_VSYS input leakage current may be in the range of 10 nA to 2.5 μ A when applying 0.45 V.

Note

The resistor voltage divider shall be designed such that its output voltage never exceeds the maximum value defined in the *Recommended Operating Conditions* section, during normal operating conditions.

[Figure 9-6](#) presents an example, where the system power supply is nominally 5 V and the maximum trigger threshold is 5 V - 10%, or 4.5 V.

For this example, it is important to understand which variables effect the maximum trigger threshold when selecting resistor values. It is obvious a device which has a VMON_VSYS input threshold of 0.45 V + 3% needs to be considered when trying to design a voltage divider that doesn't trip until the system supply drops 10%. The effect of resistor tolerance and input leakage also needs to be considered, but how these contributions effect the maximum trigger point may not be obvious. When selecting component values which produce a maximum trigger voltage, the system designer must consider a condition where the value of R1 is 1% low and the value of R2 is 1% high combined with a condition where input leakage current for the VMON_VSYS pin is 2.5 μ A. When implementing a resistor divider where R1 = 4.81 K Ω and R2 = 40.2 K Ω , the result is a maximum trigger threshold of 4.523 V.

Once component values have been selected to satisfy the maximum trigger voltage as described above, the system designer can determine the minimum trigger voltage by calculating the applied voltage that produces an output voltage of 0.45 V - 3% when the value of R1 is 1% high and the value of R2 is 1% low, and the input leakage current is 10 nA, or zero. Using an input leakage of zero with the resistor values given above, the result is a minimum trigger threshold of 4.008 V.

This example demonstrates a system power supply voltage trip point that ranges from 4.008 V to 4.523 V. Approximately 250 mV of this range is introduced by VMON_VSYS input threshold accuracy of $\pm 3\%$, approximately 150 mV of this range is introduced by resistor tolerance of $\pm 1\%$, and approximately 100 mV of this range is introduced by loading error when VMON_VSYS input leakage current is 2.5 μA .

The resistor values selected in this example produces approximately 100 μA of bias current through the resistor divider when the system supply is 4.5 V. The 100 mV of loading error mentioned above could be reduced to about 10 mV by increasing the bias current through the resistor divider to approximately 1 mA. So resistor divider bias current vs loading error is something the system designer needs to consider when selecting component values.

The system designer should also consider implementing a noise filter on the voltage divider output since VMON_VSYS has minimum hysteresis and a high-bandwidth response to transients. This could be done by installing a capacitor across R1 as shown in Figure 9-6. However, the system designer must determine the response time of this filter based on system supply noise and expected response to transient events.

Figure 9-6. System Supply Monitor Voltage Divider Circuit

VMON_1P8_MCU and VMON_1P8_SOC pins provide a way to monitor external 1.8 V power supplies. An internal resistor divider with software control is implemented inside the SoC for each of these pins. Software can program each internal resistor divider to create appropriate under voltage and over voltage interrupts.

VMON_3P3_MCU and VMON_3P3_SOC pins provide a way to monitor external 3.3 V power supplies. An internal resistor divider with software control is implemented inside the SoC for each of these pins. Software can program each internal resistor divider to create appropriate under voltage and over voltage interrupts.

9.3.6 High Speed Differential Signal Routing Guidance

The [High Speed Interface Layout Guidelines](#) provides guidance for successful routing of the high speed differential signals. This includes PCB stackup and materials guidance as well as routing skew, length and spacing limits. TI supports *only* designs that follow the board design guidelines contained in the application report.

9.3.7 Thermal Solution Guidance

The [Thermal Design Guide for DSP and ARM Application Processors](#) provides guidance for successful implementation of a thermal solution for system designs containing this device. This document provides background information on common terms and methods related to thermal solutions. TI only supports designs that follow system design guidelines contained in the application report.

10 Device and Documentation Support

10.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, AM2434_ALV, AM2432_ALV, AM2431_ALV). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of AM243x devices in the ALV package type, see the Package Option Addendum of this document, the TI website (ti.com), or contact your TI sales representative.

10.1.1 Standard Package Symbolization

Note

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

- To designate the stages in the product development cycle, TI assigns prefixes to the part numbers. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices. Prototype devices are shipped against the following disclaimer:
“This product is still in development and is intended for internal evaluation purposes.”
Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, of this device.
- Functional Safety features are not supported by ALX package.
- Applies to device max junction temperature.

Note

BLANK in the symbol or part number is collapsed so there are no gaps between characters.

10.2 Tools and Software

The following products support development for AM243x platforms:

Development Tools

Code Composer Studio™ Integrated Development Environment Code Composer Studio (CCS) Integrated Development Environment (IDE) is a development environment that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

SysConfig-PinMux Tool The SysConfig-PinMux Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI Embedded Processor devices. The tool can be used to automatically calculate the optimal pinmux configuration to satisfy entered system requirements. The tool will generate output C header/code files that can be imported into software development kits (SDKs) and used to configure customer's software to meet custom hardware requirements.

Power Estimation Tool (PET) Power Estimation Tool (PET) provides users the ability to gain insight in to the power consumption of select TI processors. The tool includes the ability for the user to choose multiple application scenarios and understand the power consumption as well as how advanced power saving techniques can be applied to further reduce overall power consumption.

10.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the processor, related peripherals, and other technical collateral is listed below.

The following documents describe the AM243x family of devices.

Technical Reference Manual

[AM64x/AM243x Processors Silicon Revision 1.0 Technical Reference Manual](#) Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the AM243x family of devices.

Errata

[AM64x/AM243x Processors Silicon Revision 1.0 Silicon Errata](#) Describes the known exceptions to the functional specifications for the device.

10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
